

Meet The Professor
**Optimizing the Management
of Acute Myeloid Leukemia**

Rebecca L Olin, MD, MSCE
Associate Professor of Medicine
Division of Hematology/Oncology
Department of Medicine
University of California, San Francisco
San Francisco, California

Commercial Support

This activity is supported by educational grants from Bristol-Myers Squibb Company, Genentech, a member of the Roche Group, and Servier Pharmaceuticals LLC.

Dr Love — Disclosures

Dr Love is president and CEO of Research To Practice. Research To Practice receives funds in the form of educational grants to develop CME activities from the following companies: AbbVie Inc, Adaptive Biotechnologies Corporation, ADC Therapeutics, Agios Pharmaceuticals Inc, Alexion Pharmaceuticals, Amgen Inc, Array BioPharma Inc, a subsidiary of Pfizer Inc, Astellas, AstraZeneca Pharmaceuticals LP, Aveo Pharmaceuticals, Bayer HealthCare Pharmaceuticals, BeiGene Ltd, BeyondSpring Pharmaceuticals Inc, Blueprint Medicines, Boehringer Ingelheim Pharmaceuticals Inc, Bristol-Myers Squibb Company, Celgene Corporation, Clovis Oncology, Coherus BioSciences, CTI BioPharma Corp, Daiichi Sankyo Inc, Eisai Inc, EMD Serono Inc, Epizyme Inc, Exact Sciences, Exelixis Inc, Five Prime Therapeutics Inc, Foundation Medicine, G1 Therapeutics Inc, Genentech, a member of the Roche Group, Genmab, Gilead Sciences Inc, GlaxoSmithKline, Grail Inc, Halozyme Inc, Helsinn Healthcare SA, ImmunoGen Inc, Incyte Corporation, Ipsen Biopharmaceuticals Inc, Janssen Biotech Inc, administered by Janssen Scientific Affairs LLC, Jazz Pharmaceuticals Inc, Karyopharm Therapeutics, Kite, A Gilead Company, Lilly, Loxo Oncology Inc, a wholly owned subsidiary of Eli Lilly & Company, Merck, Mersana Therapeutics Inc, Natera Inc, Novartis, Novocure Inc, Oncopeptides, Pfizer Inc, Pharmacyclics LLC, an AbbVie Company, Puma Biotechnology Inc, Regeneron Pharmaceuticals Inc, Sanofi Genzyme, Seagen Inc, Servier Pharmaceuticals LLC, Sumitomo Dainippon Pharma Oncology Inc, Taiho Oncology Inc, Takeda Pharmaceuticals USA Inc, Tesaro, A GSK Company, TG Therapeutics Inc, Turning Point Therapeutics Inc, Verastem Inc and Zymeworks Inc.

Research To Practice CME Planning Committee Members, Staff and Reviewers

Planners, scientific staff and independent reviewers for Research To Practice have no relevant conflicts of interest to disclose.

Dr Olin — Disclosures

Advisory Committee	Astellas
Consulting Agreements	AbbVie Inc, Actinium Pharmaceuticals Inc, Amgen Inc

We Encourage Clinicians in Practice to Submit Questions

Feel free to submit questions now before the program begins and throughout the program.

Familiarizing Yourself with the Zoom Interface

Expand chat submission box

The screenshot shows a Zoom meeting interface. At the top, there are video thumbnails for participants: RTP Coordinat..., Kirsten Miller, RTP Mike Rivera, and Lisa Suarez. Below the thumbnails is a slide titled "Meet The Professor Program Steering Committee" with six members listed:

- John N Allan, MD**
Assistant Professor of Medicine
Weill Cornell Medicine
New York, New York
- Ian W Flinn, MD, PhD**
Director of Lymphoma Research Program
Sarah Cannon Research Institute
Tennessee Oncology
Nashville, Tennessee
- Steven Coutre, MD**
Professor of Medicine (Hematology)
Stanford University School of Medicine
Stanford, California
- Prof John G Gribben, MD, DSc, FMedSci**
Chair of Medical Oncology
Barts Cancer Institute
Queen Mary University of London
Charterhouse Square
London, United Kingdom
- Matthew S Davids, MD, MMSc**
Associate Professor of Medicine
Harvard Medical School
Director of Clinical Research
Division of Lymphoma
Dana-Farber Cancer Institute
Boston, Massachusetts
- Brian T Hill, MD, PhD**
Director, Lymphoid Malignancy Program
Cleveland Clinic Taussig Cancer Institute
Cleveland, Ohio

The chat window on the right shows two messages from "Me to Panelists" and "Me to Panelists and Attendees" at 4:31 PM and 4:32 PM respectively. The messages contain a welcome message and a link to a PDF slide: http://images.researchtopractice.com/2021/Meetings/Slides/MTP_ToGo_CLL_2021_April1.pdf. The chat submission box at the bottom right is expanded, showing a red arrow pointing to the white line above the "Type message here..." input field.

Drag the white line above the submission box up to create more space for your message.

Familiarizing Yourself with the Zoom Interface

Increase chat font size

The screenshot displays a Zoom meeting interface. At the top, there are video thumbnails for participants: RTP Coordinator, Kirsten Miller, RTP Mike Rivera, and Lisa Suarez. The main content area shows a slide titled "Research To Practice CME Planning Committee Members, Staff and Reviewers" with the text: "Planners, scientific staff and independent reviewers for Research To Practice have no relevant conflicts of interest to disclose." A "Recording..." indicator is visible in the top left of the slide area. On the right, the chat window is open, showing a message from "Me to Panelists" at 4:32 PM. The message content is: "Welcome and thank you for attending! To access the slides from today's session please use the link below. http://images.researchtopractice.com/2021/Meetings/Slides/MTP_ToGo_CLL_2021_April 1.pdf". A red arrow points to the font size adjustment icon (a square with a plus sign) in the chat window's header. A "150%" font size indicator is visible over the chat message.

**Press Command (for Mac) or Control (for PC) and the + symbol.
You may do this as many times as you need for readability.**

ONCOLOGY TODAY

WITH DR NEIL LOVE

Key Presentations on Acute Myeloid Leukemia and Myelodysplastic Syndromes from ASH 2021

Agenda

Introduction: Journal Club with Dr Olin – Evaluation of the Older Patient with AML

Module 1: Case Presentations

- Dr Sood: An 88-year-old woman with transfusion-dependent AML secondary to myelodysplastic syndrome
- Dr Keruakous: A frail 75-year-old man with newly diagnosed poor-risk AML and FLT3-ITD and IDH1 mutations
- Dr Sharma: A 67-year-old woman with relapsed AML and a FLT3-ITD mutation
- Dr Cook: A 57-year-old man with AML receives 7 + 3 induction prior to discovery of complex cytogenetics

Module 2: ASH 2021 Review – Part 1

Module 3: Case Presentations

- Dr Rupard: A 71-year-old man with relapsed AML and an IDH2 mutation
- Dr Bhatnagar: A 58-year-old man with therapy-related AML and a KMT2A rearrangement
- Dr Palmer: A 78-year-old man with AML and a TP53 mutation
- Dr Keruakous: A 46-year-old woman with newly diagnosed poor-risk AML and an ejection fraction of 35%

Module 4: ASH 2021 Review – Part 2

Module 5: Faculty Survey

Module 6: Appendix: Key Recent Data Sets

Module 5: Faculty Survey

Module 6: Appendix: Key Recent Data Sets

In general, which treatment would you recommend for an 88-year-old patient who is receiving azacitidine for myelodysplastic syndrome and develops AML (25% blasts) with no actionable mutations?

1. Continue azacitidine and add venetoclax
2. Venetoclax
3. Decitabine
4. Decitabine + venetoclax
5. CPX-351
6. Low-dose cytarabine + venetoclax
7. Other

Case Presentation: An 88-year-old woman with transfusion-dependent AML secondary to myelodysplastic syndrome

Dr Raman Sood (Dunkirk, New York)

Regulatory and reimbursement issues aside, which initial treatment would you recommend for a 75-year-old patient who is not eligible for intensive chemotherapy who presents with poor-risk AML and FLT3-ITD and IDH1 mutations?

1. Gilteritinib
2. Ivosidenib
3. Hypomethylating agent (HMA) alone
4. HMA + venetoclax
5. HMA + venetoclax + FLT3 inhibitor
6. HMA + venetoclax + ivosidenib
7. CPX-351
8. Other

Case Presentation: A frail 75-year-old man with newly diagnosed poor-risk AML and FLT3-ITD and IDH1 mutations

Dr Amany Keruakous (Augusta, Georgia)

Case Presentation: A frail 75-year-old man with newly diagnosed poor-risk AML and FLT3-ITD and IDH1 mutations (continued)

Dr Amany Keruakous (Augusta, Georgia)

Case Presentation: A 67-year-old woman with relapsed AML and a FLT3-ITD mutation

Dr Prashant Sharma (Salt Lake City, Utah)

Case Presentation: A 57-year-old man with AML receives 7 + 3 induction therapy prior to discovery of trisomy 8, t(8;21) and a KIT mutation

Dr Rachel Cook (Portland, Oregon)

Agenda

Module 4: ASH 2021 Review – Part 2

Module 5: Faculty Survey

Module 6: Appendix: Key Recent Data Sets

Outcomes in Patients with Poor-Risk Cytogenetics with or without TP53 Mutations Treated with Venetoclax Combined with Hypomethylating Agents

- Pooled analysis of patients with poor and int risk cytogenetics
 - VIALE-A and Ph1b trial of patients with NCCN int/poor risk (n=232/144)

Venetoclax Plus Decitabine for Young Adults with Newly Diagnosed ELN Adverse-Risk Acute Myeloid Leukemia: Interim Analysis of a Prospective, Multicenter, Single-Arm, Phase 2 Trial

- Patients 18-59 with newly diagnosed ELN Adverse Risk AML
 - Decitabine 20mg/m² d1-5, Venetoclax 100, 200, 400 continued through 28d
 - Patients with FLT3-ITD received Decitabine+Venetoclax +/- Sorafenib
- Primary endpoint: superiority of composite remission vs. historic 7+3

Figure 1. The efficacy of venetoclax + decitabine vs IA (IDA 12mg/m²)

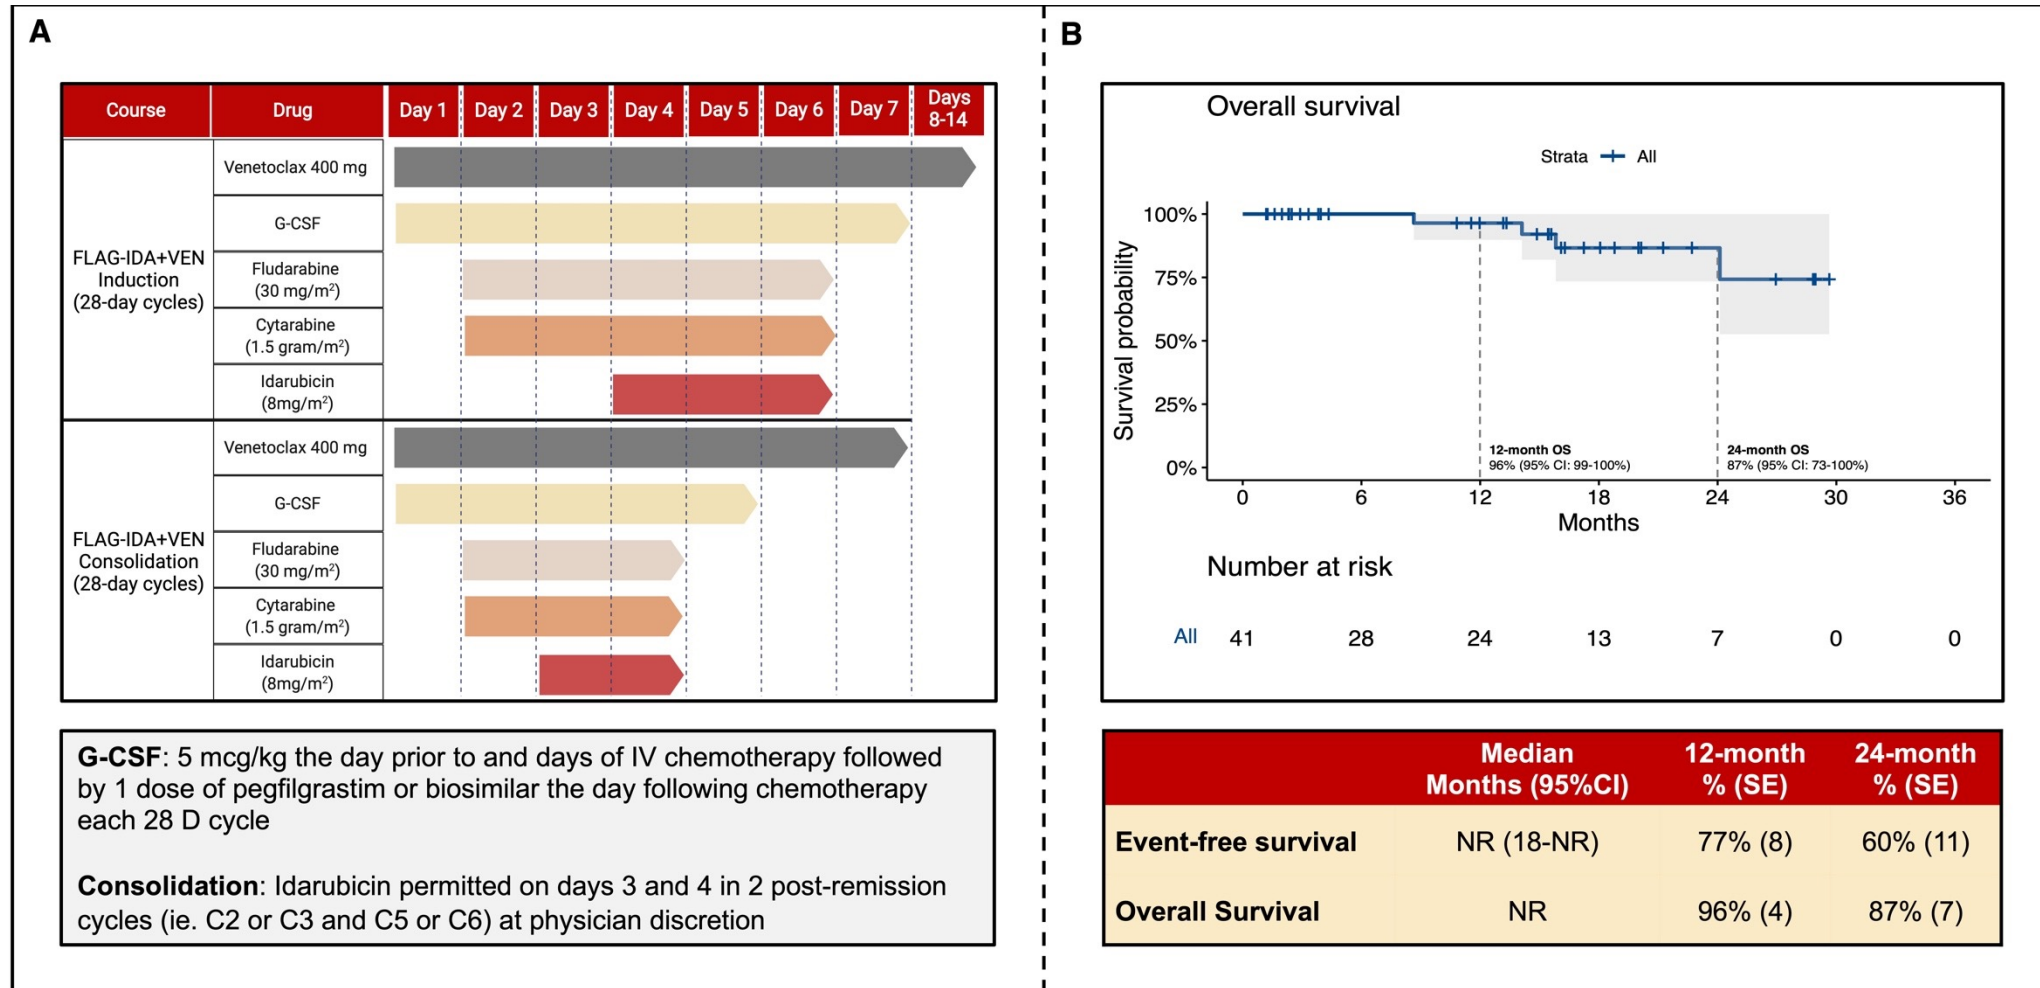

Comparing Outcomes between Liposomal Daunorubicin/Cytarabine (CPX-351) and HMA+Venetoclax As Frontline Therapy in Acute Myeloid Leukemia

- Retrospective study from 4 academic centers of patients treated with CPX-351 or HMA+Ven

	CPX-351 (n=211)	HMA+Ven (n=226)
CR	98 (46%)	62 (27%)
CRi	24 (11%)	66 (29%)
RFS	33.7mo	15.8mo
OS	17.3mo	11.1mo

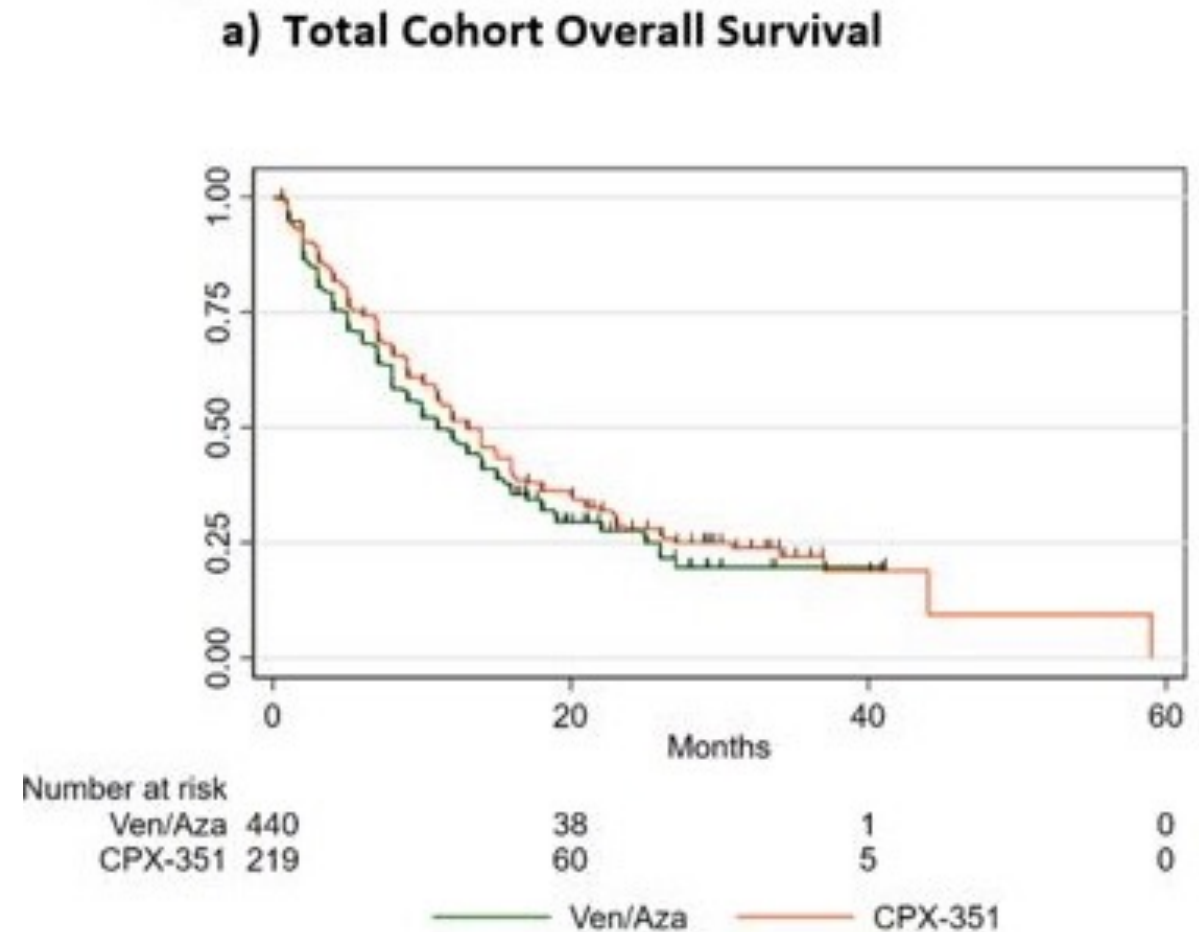

Venetoclax Combined with FLAG-IDA Induction and Consolidation in Newly Diagnosed Acute Myeloid Leukemia

Real World Survival Outcomes of CPX-351 Versus Venetoclax and Azacitadine for Initial Therapy in Adult Acute Myeloid Leukemia

- HUP and Flatiron HER
- CPX-351 (n=219)
- Aza+Ven (n=440)

- Overall survival similar at 13mo (CPX-351) vs 11mo (AzaVen) (p=0.18)
- Higher rates of F&N with CPX351

AGILE: A Global, Randomized, Double-Blind, Phase 3 Study of Ivosidenib + Azacitidine Versus Placebo + Azacitidine in Patients with Newly Diagnosed Acute Myeloid Leukemia with an *IDH1* Mutation

- Randomize 1:1 Aza+Ivosidenib vs Aza+Placebo
 - Aza 75mg/m² d1-7 of 28, Ivo 500mg d1-28

	Azacitidine+Ivosidenib (n=72)	Azacitidine (n=74)
CR	34 (47%)	11 (15%)
CR+CRh	38 (53%)	13 (18%)
ORR	45 (63%)	14 (19%)

- Toxicities balanced; fewer infections in the AZA+IVO arm
- HRQoL favored AZA+IVO

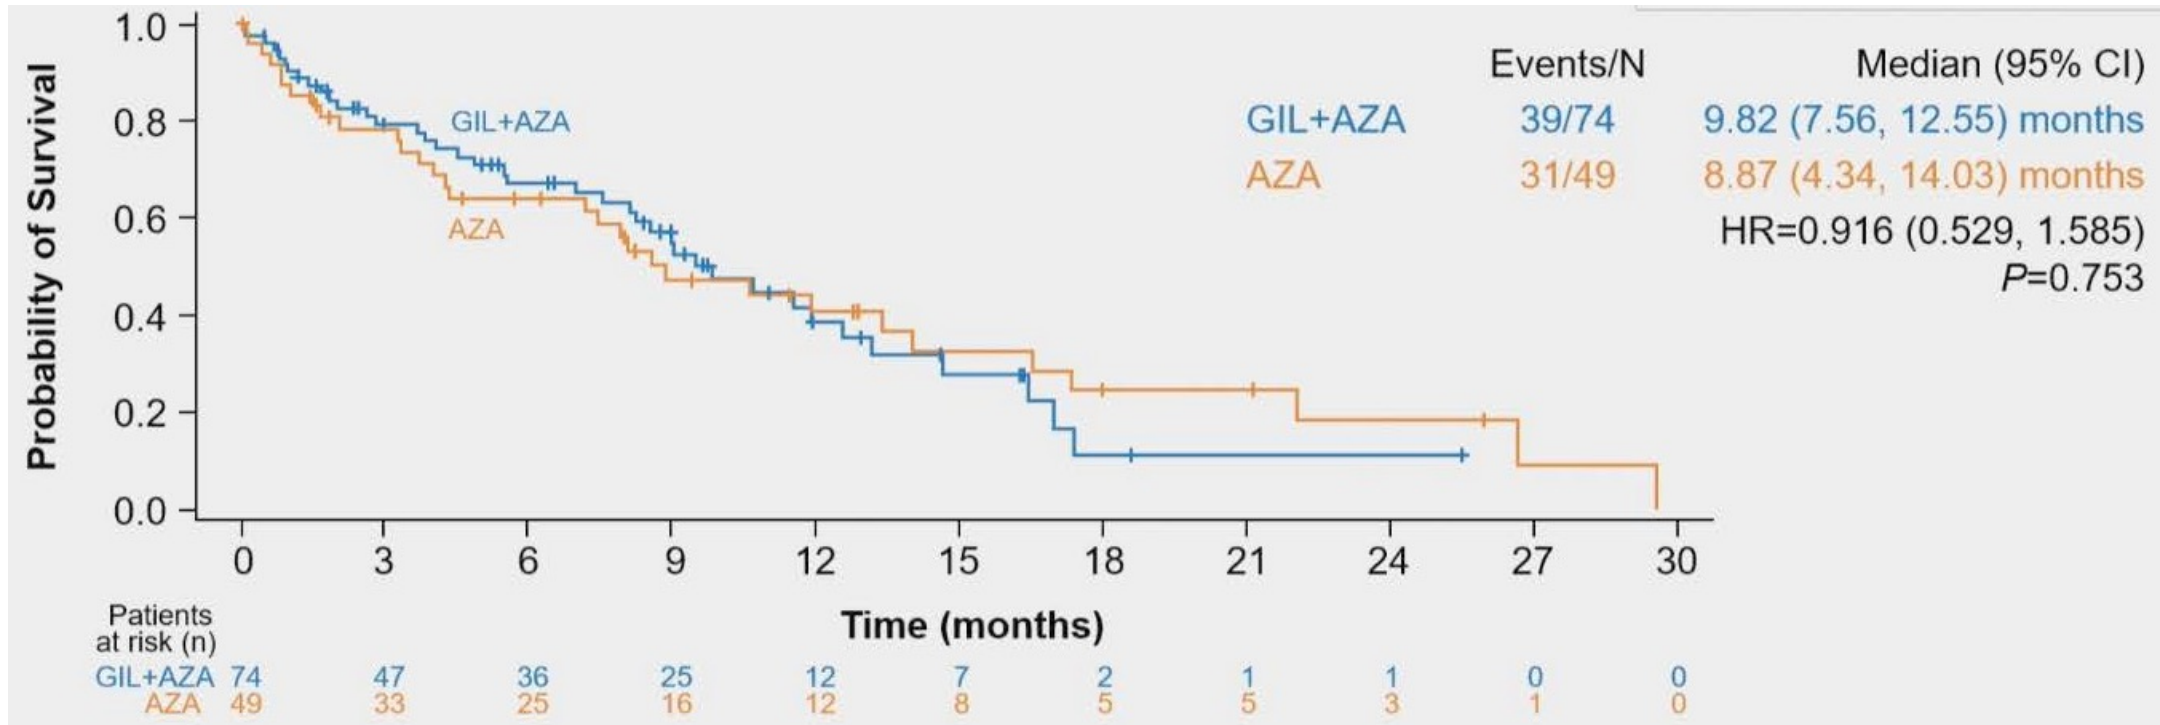

Gilteritinib Versus Salvage Chemotherapy for Relapsed/Refractory FLT3-Mutated Acute Myeloid Leukemia: A Phase 3, Randomized, Multicenter, Open-Label Trial in Asia

Figure

Phase 3, Open-Label, Randomized Study of Gilteritinib and Azacitidine Vs Azacitidine for Newly Diagnosed FLT3-Mutated Acute Myeloid Leukemia in Patients Ineligible for Intensive Induction Chemotherapy

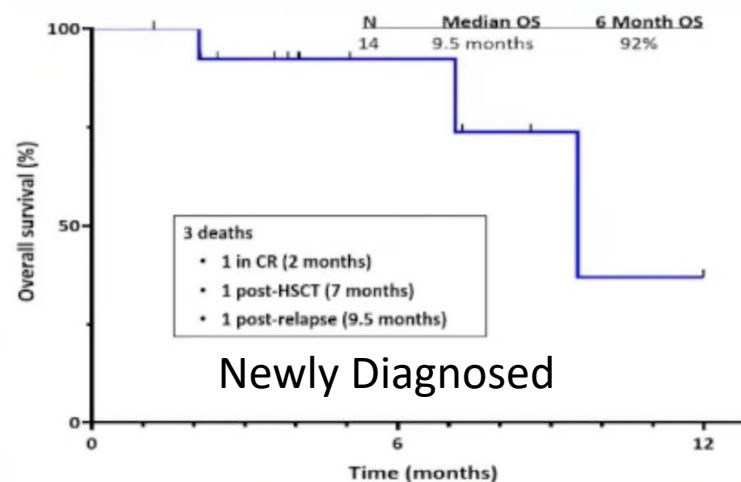

A Triplet Combination of Azacitidine, Venetoclax and Gilteritinib for Patients with *FLT3*-Mutated Acute Myeloid Leukemia: Results from a Phase I/II Study

- R/R *FLT3* AML (n=14), HR-MDS/CMML (n=1), and ND *FLT3* AML (n=11)

Agenda

Introduction: Journal Club with Dr Olin – Evaluation of the Older Patient with AML

Module 1: Case Presentations

- Dr Sood: An 88-year-old woman with transfusion-dependent AML secondary to myelodysplastic syndrome
- Dr Keruakous: A frail 75-year-old man with newly diagnosed poor-risk AML and FLT3-ITD and IDH1 mutations
- Dr Sharma: A 67-year-old woman with relapsed AML and a FLT3-ITD mutation
- Dr Cook: A 57-year-old man with AML receives 7 + 3 induction prior to discovery of complex cytogenetics

Module 2: ASH 2021 Review – Part 1

Module 3: Case Presentations

- Dr Rupard: A 71-year-old man with relapsed AML and an IDH2 mutation
- Dr Bhatnagar: A 58-year-old man with therapy-related AML and a KMT2A rearrangement
- Dr Palmer: A 78-year-old man with AML and a TP53 mutation
- Dr Keruakous: A 46-year-old woman with newly diagnosed poor-risk AML and an ejection fraction of 35%

Module 4: ASH 2021 Review – Part 2

Module 5: Faculty Survey

Module 6: Appendix: Key Recent Data Sets

In what clinical situations, if any, do you recommend HMA/venetoclax for a patient with AML who is eligible for intensive chemotherapy (eg, adverse cytogenetics)?

Dr Daver

TP53 mut, adverse cytogenetics, PS ≥ 3 , severe cardiac, renal or other comorbidity

Dr Pratz

Age >65 , complex karyotype, TP53, IDH2 mutations, INV3 or t(3;3)

Dr Fathi

Possibly if TP53 mutation present

Dr Stein

Adverse-risk AML, anticipated response to induction tx $< 30\%$

Dr Olin

If patient prefers nonintensive therapy

Dr Stock

Adverse cytogenetics/molecular genetics, TP53 mutation

Dr Pollyea

Age >65 , ELN adverse risk, secondary or tAML, IDH mutations

Prof Wei

Age ≥ 70 if not CBF, FLT3-ITD, TP53 mut, prior MPN

HMA = hypomethylating agent; tAML = treatment-related AML

Do you generally admit to the hospital all patients with AML who are receiving venetoclax in combination with a hypomethylating agent (HMA)?

Dr Daver

Yes

Dr Pratz

No

Dr Fathi

Yes

Dr Stein

No

Dr Olin

No

Dr Stock

No

Dr Pollyea

Yes

Prof Wei

Yes, unless blasts are low

For a patient with AML who is pancytopenic and is receiving venetoclax in combination with an HMA or low-dose cytarabine(LDAC), when do you perform the first bone marrow evaluation?

Dr Daver

Between days 21 and 28 of cycle 1

Dr Pratz

Between days 22 and 28

Dr Fathi

At end of cycle 1

Dr Stein

Day 28

Dr Olin

At end of cycle 1

Dr Stock

Around day 21

Dr Pollyea

Cycle 1, day 28

Prof Wei

Day 21-28 if circulating blasts cleared

A 65-year-old patient with intermediate-risk AML, no actionable mutations, PS 0, receives 7 + 3 induction therapy, achieves a complete remission after 2 cycles and then receives 2 cycles of high-dose cytarabine consolidation but declines transplant. Would you offer this patient maintenance therapy?

Dr Daver

**Yes, azacitidine +
venetoclax or CC-486**

Dr Pratz

Yes, CC-486

Dr Fathi

Yes, CC-486

Dr Stein

Yes, CC-486

Dr Olin

Yes, CC-486

Dr Stock

Yes, CC-486

Dr Pollyea

Yes, CC-486

Prof Wei

Yes, CC-486

Regulatory and reimbursement issues aside, what initial treatment would you recommend for a younger patient who is eligible for intensive chemotherapy who presents with AML and a FLT3-ITD mutation?

 Dr Daver	CLIA + gilteritinib FLAG-IDA + gilteritinib	 Dr Pratz	7 + 3 + midostaurin
 Dr Fathi	7 + 3 + midostaurin	 Dr Stein	7 + 3 + midostaurin
 Dr Olin	7 + 3 + midostaurin	 Dr Stock	7 + 3 + midostaurin
 Dr Pollyea	7 + 3 + midostaurin	 Prof Wei	7 + 3 + midostaurin

CLIA = trial regimen, cladribine, high-dose cytarabine and idarubicin

Regulatory and reimbursement issues aside, what initial treatment would you recommend for an older patient who is not eligible for intensive chemotherapy who presents with AML and a FLT3-ITD mutation?

 Dr Daver	Azacitadine + venetoclax + gilteritinib	 Dr Pratz	Azacitidine + venetoclax
 Dr Fathi	HMA + venetoclax + gilteritinib	 Dr Stein	Azacitidine + venetoclax
 Dr Olin	HMA + venetoclax	 Dr Stock	Azacitadine + venetoclax (add gilteritinib if no response at day 21)
 Dr Pollyea	Azacitadine + venetoclax	 Prof Wei	Azacitadine + venetoclax + gilteritinib

HMA: azacitidine or decitabine

Regulatory and reimbursement issues aside, what initial treatment would you recommend for a younger patient who is eligible for intensive chemotherapy who presents with AML and an IDH1 mutation?

Dr Daver

FLAG-IDA + venetoclax
or CLIA + venetoclax

Dr Pratz

7 + 3 induction +
ivosidenib

Dr Fathi

7 + 3 induction

Dr Stein

7 + 3 induction

Dr Olin

7 + 3 induction,
would consider
adding ivosidenib

Dr Stock

Azacitidine +
venetoclax

Dr Pollyea

7 + 3 induction

Prof Wei

7 + 3 induction

Regulatory and reimbursement issues aside, what initial treatment would you recommend for an older patient who is not eligible for intensive chemotherapy who presents with AML and an IDH1 mutation?

 Dr Daver	HMA + venetoclax or azacitidine + venetoclax + ivosidenib	 Dr Pratz	Azacitidine + venetoclax
 Dr Fathi	HMA + venetoclax	 Dr Stein	Azacitidine + venetoclax
 Dr Olin	Ivosidenib or HMA + venetoclax OR Aza + venetoclax + ivosidenib	 Dr Stock	Azacitidine + venetoclax
 Dr Pollyea	Azacitidine + venetoclax	 Prof Wei	Azacitidine + venetoclax

HMA: azacitidine or decitabine

Regulatory and reimbursement issues aside, what initial treatment would you recommend for a younger patient who is eligible for intensive chemotherapy who presents with AML and an IDH2 mutation?

Dr Daver

FLAG-IDA + venetoclax
or CLIA + venetoclax

Dr Pratz

Azacitidine +
venetoclax

Dr Fathi

7 + 3 induction

Dr Stein

7 + 3 induction

Dr Olin

7 + 3 induction,
would consider
adding enasidenib

Dr Stock

Azacitidine +
venetoclax

Dr Pollyea

7 + 3 induction

Prof Wei

7 + 3 induction

Regulatory and reimbursement issues aside, what initial treatment would you recommend for an older patient who is not eligible for intensive chemotherapy who presents with AML and an IDH2 mutation?

 Dr Daver	HMA + venetoclax or azacitidine + venetoclax + enasidenib	 Dr Pratz	Azacitidine + venetoclax
 Dr Fathi	HMA + venetoclax	 Dr Stein	Azacitidine + venetoclax
 Dr Olin	HMA + venetoclax	 Dr Stock	Azacitidine + venetoclax
 Dr Pollyea	Azacitidine + venetoclax	 Prof Wei	Azacitidine + venetoclax

HMA: azacitidine or decitabine

Module 5: Faculty Survey

Module 6: Appendix: Key Recent Data Sets

Optimal Management of Newly Diagnosed Acute Myeloid Leukemia (AML) Not Eligible for Intensive Therapy

Venetoclax Mechanism of Action

- Cancer cells increase the expression of anti-apoptotic proteins to offset the increase in pro-apoptotic proteins, tipping the balance toward cell survival
- The large # of pro-apoptotic proteins bound and sequestered by Bcl-2 in AML make them “primed” for death

VIALE-A Study Design

(NCT02993523)

Eligibility

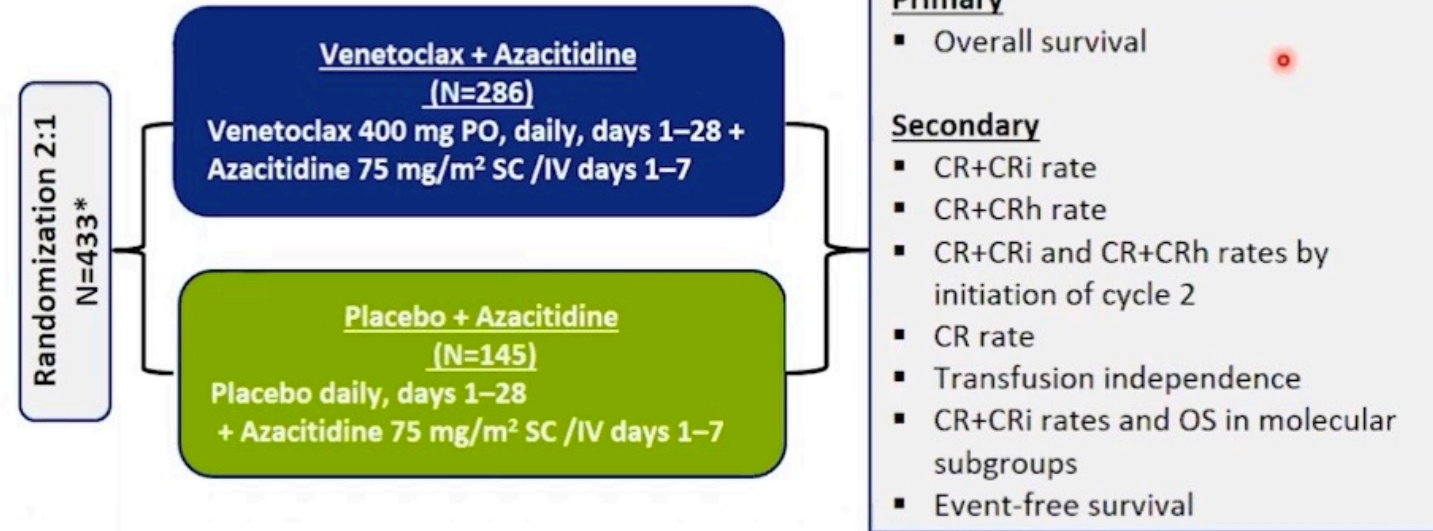

Inclusion

- Patients with newly diagnosed confirmed AML
- Ineligible for induction therapy defined as **either**
 - ❖ ≥ 75 years of age
 - ❖ 18 to 74 years of age with at least one of the co-morbidities:
 - CHF requiring treatment or Ejection Fraction $\leq 50\%$
 - Chronic stable angina
 - DLCO $\leq 65\%$ or FEV1 $\leq 65\%$
 - ECOG 2 or 3

Exclusion

- Prior receipt of any HMA, venetoclax, or chemotherapy for myelodysplastic syndrome
- Favorable risk cytogenetics per NCCN
- Active CNS involvement

Treatment

Endpoints

Primary

- Overall survival

Secondary

- CR+CRi rate
- CR+CRh rate
- CR+CRi and CR+CRh rates by initiation of cycle 2
- CR rate
- Transfusion independence
- CR+CRi rates and OS in molecular subgroups
- Event-free survival

Randomization Stratification Factors Age (<75 vs. ≥ 75 years); Cytogenetic Risk (intermediate, Poor); Region

Venetoclax dosing ramp-up

Cycle 1 ramp-up Day 1: 100 mg, Day 2: 200 mg, Day 3 - 28: 400 mg
Cycle 2 → Day 1-28: 400 mg

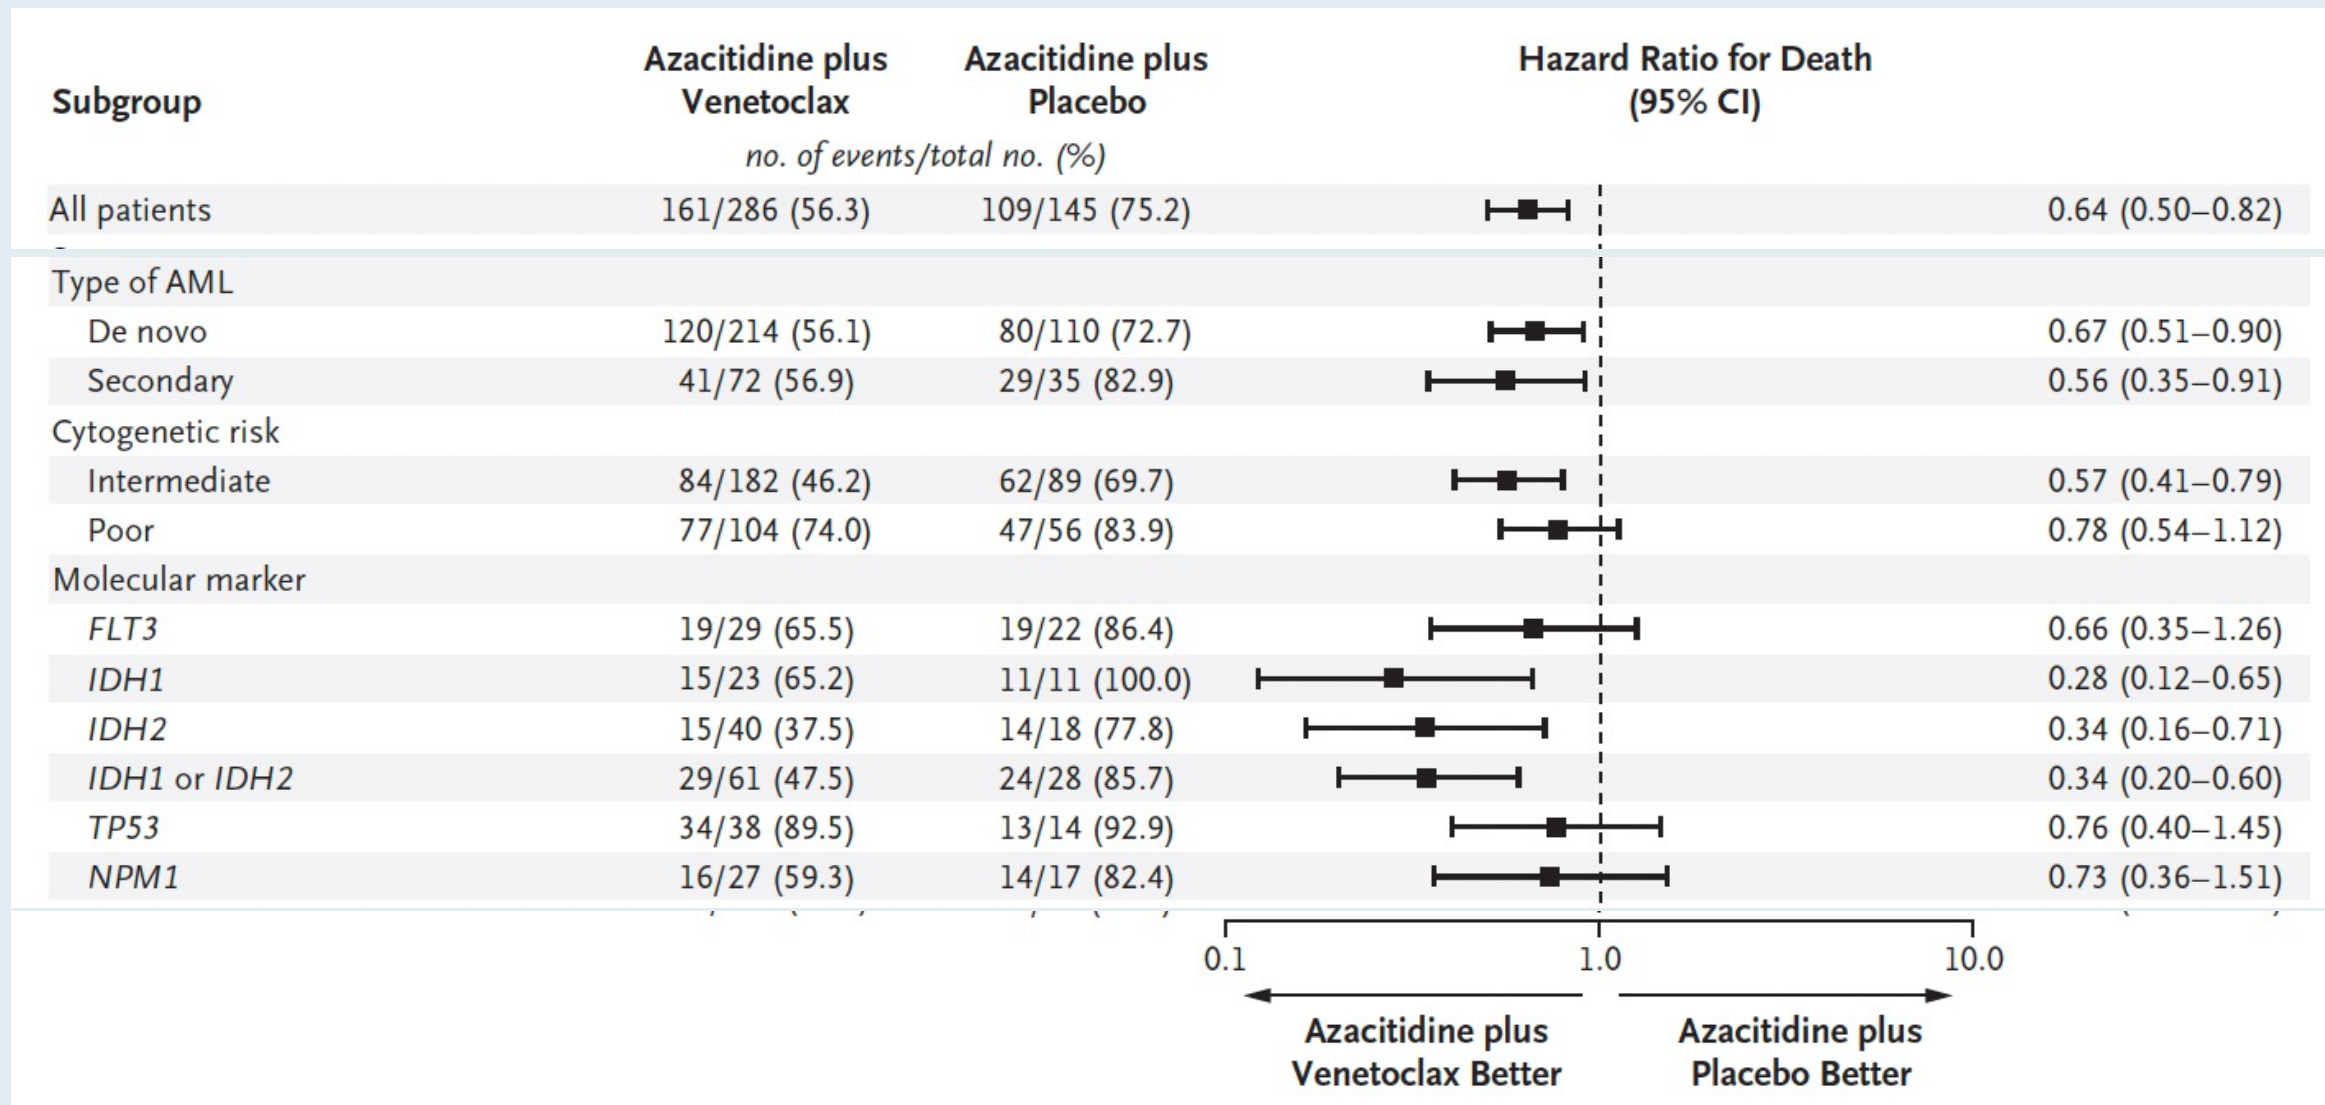

* 2 patients were not stratified by cytogenetic risk. They were excluded from efficacy analysis but included in the safety analysis. 6 patients who did not receive treatment were excluded from the safety analysis set.

AML: Acute myeloid leukemia; CHF: Congestive heart failure; CNS: Central nervous system; CR: Complete remission; CRi: CR+ incomplete marrow remission; CRh: CR+ incomplete hematologic recovery; DLCO: diffusion lung capacity for carbon monoxide; ECOG: Eastern Cooperative Oncology Group; FEV1: Forced expiratory volume; HMA: Hypomethylating agent; NCCN: National Comprehensive Cancer Network

VIALE-A: Overall Survival

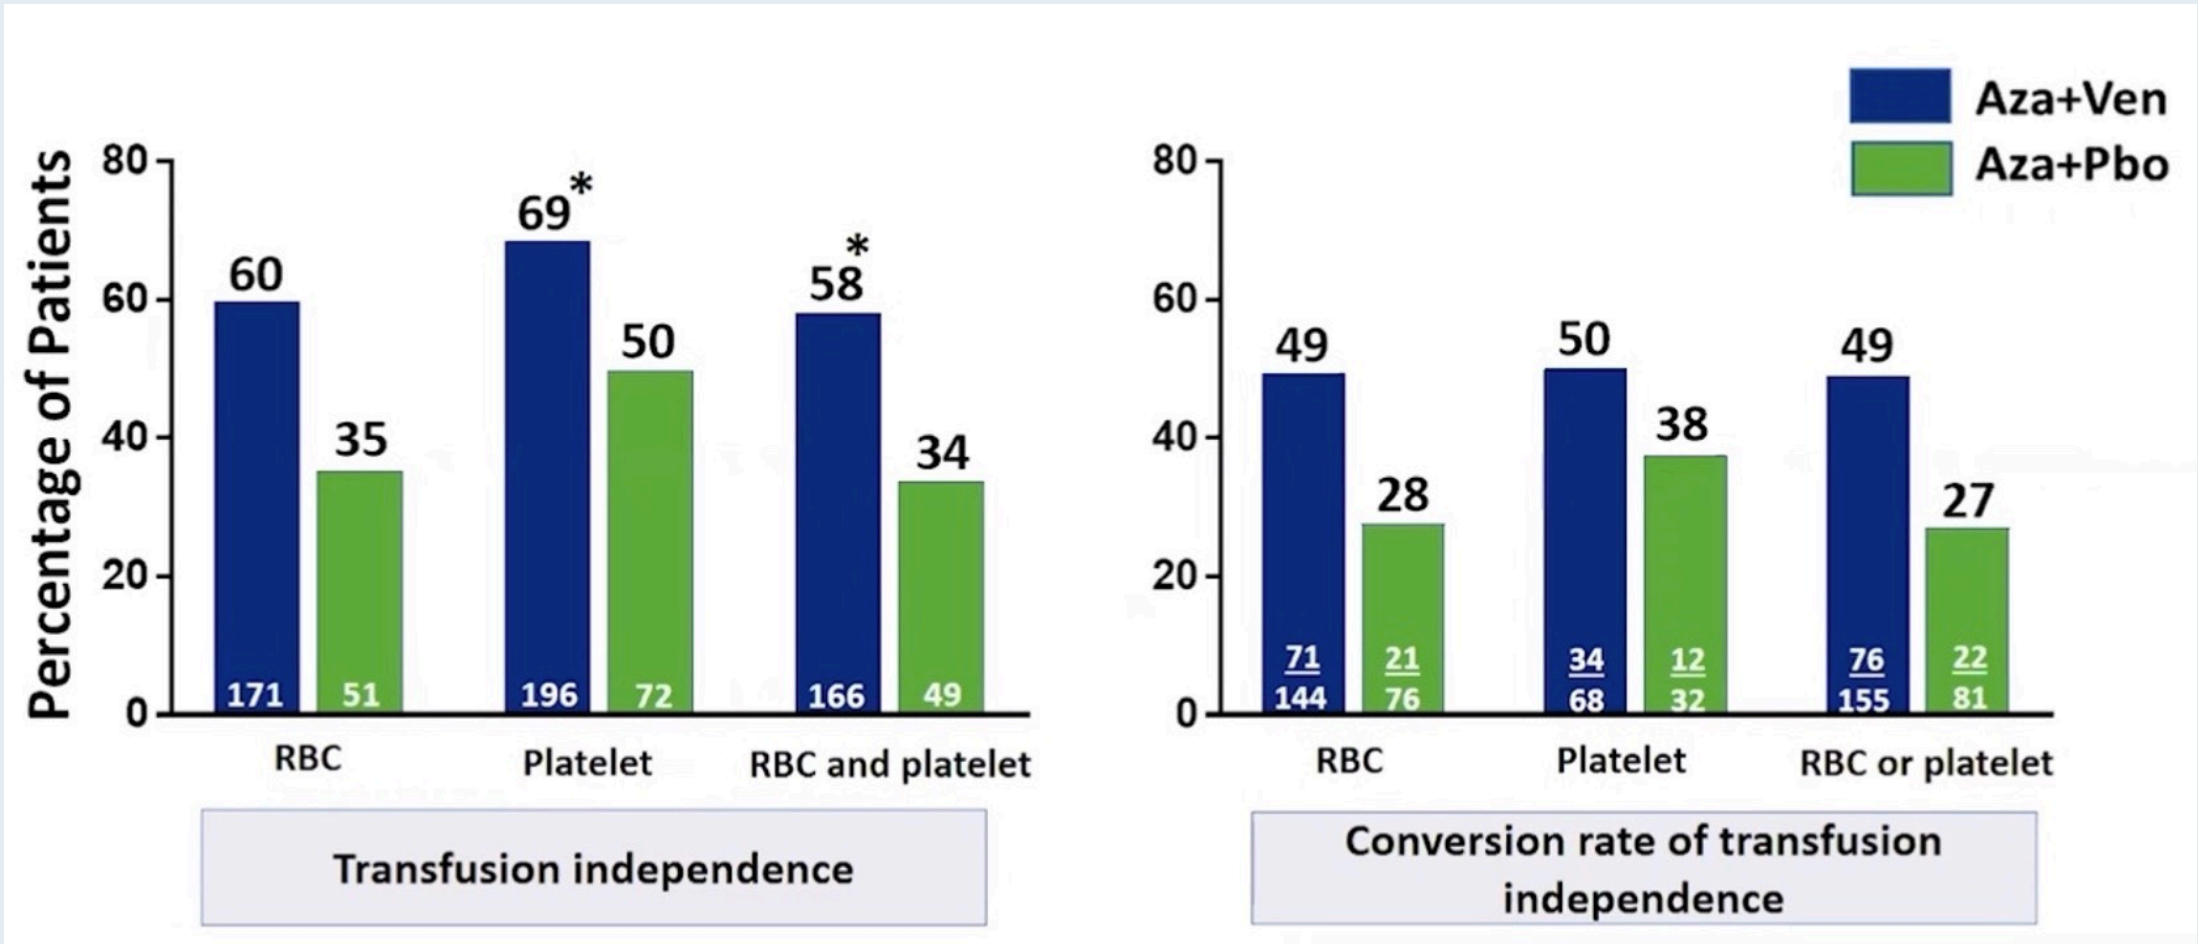

VIALE-A: Overall Survival Subgroup Analysis

VIALE-A: Response Rates (CR + CRi) in Subgroups

VIALE-A: Patients with ≥ 8 Weeks Transfusion-Free Interval

Quizartinib Added to Chemotherapy Demonstrates Superior Overall Survival Compared to Chemotherapy Alone for Adult Patients with Newly Diagnosed FLT3-ITD Positive AML

Press Release: November 18, 2021

“Positive topline results [were announced] from the global pivotal QuANTUM-First phase 3 trial evaluating quizartinib, a highly potent and selective FLT3 inhibitor, in patients with newly diagnosed *FLT3*-ITD positive acute myeloid leukemia (AML).

QuANTUM-First met its primary endpoint, demonstrating that patients who received quizartinib in combination with standard induction and consolidation chemotherapy and then continued with single agent quizartinib had a statistically significant and clinically meaningful improvement in overall survival (OS) compared to those who received standard treatment alone. The safety of quizartinib was shown to be manageable and consistent with the known safety profile.”

Follow-Up of Patients with *FLT3*-Mutated R/R AML in the Phase 3 ADMIRAL Trial

Perl AE et al.

ASCO 2021;Abstract 7013.

ADMIRAL: Updated Overall Survival and Cumulative Relapse Rate

Overall Survival in R/R *FLT3*^{mut+} AML Patients (ITT Population; N=371)

Cumulative Incidence of Relapse in Patients Achieving CRc With Gilteritinib

- With a median follow-up of 37.1 months, the median OS remained longer with gilteritinib than with salvage chemotherapy
- Most relapses after CRc occurred within 12 months and rarely occurred after 18 months

ADMIRAL: Subgroup Analysis of Overall Survival

IDH1 and IDH2 Mutations in AML

**IDH mutations are found in
~16%-20% of AML cases**

- IDH1 mutations in ~7.5%
- IDH2 mutations in ~8-19%

Pivotal Studies of IDH Inhibitor Monotherapy for AML with IDH Mutations

IDH inhibitor	Enasidenib	Ivosidenib	
FDA approval	Aug 1, 2017	July 20, 2018	May 2, 2019
Setting	Relapsed/refractory	Relapsed/refractory	Newly diagnosed

Ven+Aza	82.3 (71.9, 89.1)	69.3 (57.8, 78.3)	52.4 (40.4, 63.1)
Pbo+Aza	50.0 (30.6, 66.6)	35.7 (18.9, 53.0)	12.2 (3.2, 27.8)

Phase Ib/II Study of Ivosidenib with Venetoclax with or without Azacitidine in Patients with Myeloid Cancer and an IDH1 Mutation

- 3 x 3 dose escalation/de-escalation study exploring 4 dose levels in 25 patients with advanced MDS or MPN or newly diagnosed or R/R AML

Commonly Observed and Noteworthy IDH Inhibitor-Related Adverse Events (AEs)

Commonly Observed Treatment-Emergent AEs (Any Grade, >20%)

- **Enasidenib:** Hyperbilirubinemia, nausea
- **Ivosidenib:** Diarrhea, leukocytosis, nausea, fatigue, febrile neutropenia, dyspnea, anemia, QT prolongation, peripheral edema

Noteworthy Grade 3 and 4 AEs

- **IDH differentiation syndrome: 5%-6%**
- **Prolongation of the QT interval**
 - Enasidenib: Not reported
 - Ivosidenib: ~8%
- **Leukocytosis: 2%-3%**
- **Hyperbilirubinemia**
 - Enasidenib: 12%
 - Ivosidenib: Not reported

IDH Differentiation Syndrome (IDH-DS)

- **Potentially fatal complication of effective leukemia treatment**
 - First described in patients with APL treated with ATRA
- **Signs and symptoms of IDH-DS not specific**
 - Fever, edema, weight gain, leukocytosis, rash, hypotension, renal dysfunction, and pleural and pericardial effusions
 - A rising leukocyte count, comprising increasing neutrophils with a parallel decrease in leukemic blasts
- **Median time to onset:** ~30 days (range: 5-340 days)
- **Frequency:** 5%-6% Grade 3 or higher
 - Frequent dose interruptions but not associated with treatment discontinuation
- **Treatment**
 - Corticosteroids for IDH-DS
 - Hydroxyurea for leukocytosis, which frequently accompanies IDH-DS
 - Hyperuricemia agents for tumor lysis syndrome, which may co-occur

Incidence and Management of Secondary AML (sAML)

Survival by AML Diagnosis

AML-MRC: AML with MDS-Related Changes

Definition: AML with a history of MDS or myelodysplasia-related cytogenetic findings, specifically $\geq 20\%$ blasts in the peripheral blood or bone marrow and any of the following:

- **Previously documented** MDS or MDS/MPN
- Myelodysplasia-related **cytogenetic abnormalities**
- Morphologic detection of **multilineage dysplasia**

1. **Complex karyotype** (3 or more abnormalities).
2. **Unbalanced abnormalities:** $-7/\text{del}(7q)$, $\text{del}(5q)/\text{t}(5q)$, $i(17q)/\text{t}(17p)$, $-13/\text{del}(13q)$, $\text{del}(11q)$, $\text{del}(12p)/\text{t}(12p)$, $\text{idic}(X)(q13)$.
3. **Balanced abnormalities:** $\text{t}(11;16)(q23.3;p13.3)$, $\text{t}(3:21)(q26.2;q22.1)$, $\text{t}(1;3)(p36.3;q21.2)$, $\text{t}(2;11)(p21;q23.3)$, $\text{t}(5;12)(q32;p13.2)$, $\text{t}(5;7)(q32;q11.2)$, $\text{t}(5;17)(q32;p13.2)$, $\text{t}(5;10)(q32;q21.2)$, $\text{t}(3;5)(q25.3;q35.1)$

Footnote 1. The presence of 50% or more dysplastic cells in at least 2 cell lines, **excluding cases when a mutation of NPM1 or biallelic mutation of CEBPA is present.**

Therapy-Related AML

The WHO defines t-AML as AML that arises from prior cytotoxic therapy or ionizing radiotherapy for an unrelated disease. Estimated to account for 5-10% of all AML cases.

Primary malignancy prior to tAML

Cytotoxic therapy ^a	MOA	Examples	Latency period
Alkylating agents and radiation	Induce chromosomal deletions, commonly in 5 and/or 7	Cyclophosphamide, mechlorethamine, procarbazine, chlorambucil, melphalan, carmustine, busulfan	5-10 years
Topoisomerase II inhibitors	Induce chromosomal translocations	Etoposide, teniposide, mitoxantrone, epirubicin, and doxorubicin	2-3 years
