

# Targeted Treatment of Metastatic Lung Cancer

Ibiayi Dagogo-Jack, MD  
Assistant Professor of Medicine  
Massachusetts General Hospital Cancer Center  
Harvard Medical School

## Discussion Question

**How do you generally approach therapeutic selection for patients with metastatic non-small cell lung cancer (NSCLC) and EGFR mutations who experience disease progression on front-line osimertinib? Do you believe patritumab deruxtecan and/or amivantamab/lazertinib will play a role in this setting in the near future?**

# Approach to EGFR+ NSCLC After Progression on 1<sup>st</sup> Line Osimertinib

- **What is the extent of progression?**
  - Consider local therapy and continuing osimertinib beyond progression
  - Progressing brain metastases?
- **What is the molecular basis of progression?**
  - Repeat biopsy (tissue vs plasma)
- **How aggressive is the progression?**
  - Could this be SCLC?
  - Symptomatic?
- **Next Line Treatment Options?**
  - Chemo +/- Osimertinib vs Clinical Trial vs Off-Label Combination

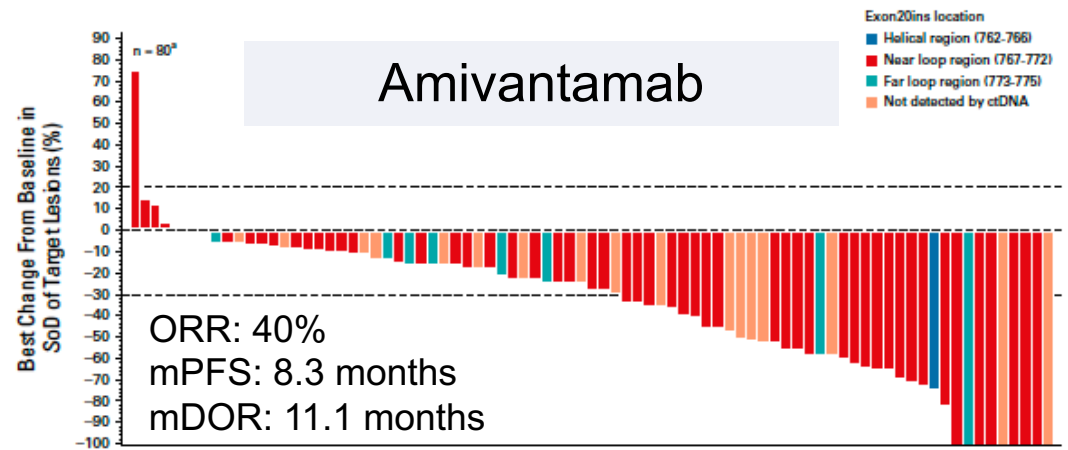

# Discussion Question

**In which line of treatment do you administer targeted therapy to your patients with metastatic NSCLC and EGFR exon 20 insertion mutations? How do you select between amivantamab and mobocertinib?**

# Management of EGFR Exon 20+ NSCLC

- PCR assays miss ~50% of EGFR exon 20 insertions.
- Drug discontinuation for toxicity: Amivantamab (10%), Mobocertinib (17%). **I start with Amivantamab.**
- We need better targeted therapies for EGFR ex20 mutations with brain mets.
- Note: ~40% of pts had CNS as a site of 1<sup>st</sup> progression on Mobocertinib.

|  |                     |                     |                     |                     |  |                      |                     |                     |                     |                     |  |                     |                     |

Toxicities: Infusion reactions (66%), rash (86%), paronychia (45%), edema (18%)

Toxicities: Diarrhea (91%, 21% grade >3), nausea (34%), rash (45%), paronychia (38%), QTC prolongation (11%), rare cardiomyopathy

# Discussion Question

**In which line of treatment do you administer targeted therapy to your patients with metastatic NSCLC and MET exon 14 mutations? How do you select between capmatinib and tepotinib?**

## Management of NSCLC Harboring MET Exon 14 Skipping Alterations

- RNA-based NGS is the most optimal strategy for detecting MET skipping alterations.
- Tepotinib and Capmatinib are approved in a line-agnostic fashion. Both drugs have excellent CNS activity. I prioritize TKI therapy in the 1<sup>st</sup> line over chemotherapy + immunotherapy due to efficacy in the 1<sup>st</sup> line and potential toxicity of the reverse sequence.
- Side effects from these TKIs can impact QoL, including edema. **Both are great options, but I start with Capmatinib given the higher response rate, acknowledging lack of head-to-head data.**

# Discussion Question

**In which line of treatment do you administer targeted therapy for your patients with metastatic NSCLC and HER2 mutations? What about for those with HER2 overexpression or amplification?**

# Management of HER2-Mutant NSCLC

- Trastuzumab deruxtecan is approved for NSCLC with a HER2 mutation (not amplification).
- There are data supporting antibody-drug conjugates (T-DXd and T-DM1) for other HER2 alterations, but these are not FDA-approved indications. I currently do not check for HER2 overexpression.
- Brain metastases are common (as high as 47% of patients in a retrospective study!)
- The FDA-approved dose is 5.4 mg/kg. Higher doses are associated with more toxicity/pneumonitis.

| DESTINY Lung-02   | Prespecified early cohort |                           |
|---|---------------------------|---------------------------|
|   | T-DXd 5.4 mg/kg<br>n = 52 | T-DXd 6.4 mg/kg<br>n = 28 |
| <b>Response Assessment</b>                                  |                           |                           |
| <b>Confirmed Objective Response Rate, n (%)</b><br>[95% CI] | 28 (53.8)<br>[39.5, 67.8] | 12 (42.9)<br>[24.5, 62.8] |

| Progressive Disease   | 2 (3.8)                   | 1 (3.6)                   |
| Not evaluable   | 3 (5.8)                   | 1 (3.6)                   |
| <b>Disease Control Rate, n (%)</b><br>[95% CI]              | 47 (90.4)<br>[79.0, 96.8] | 26 (92.9)<br>[76.5, 99.1] |
| <b>Interstitial Lung Disease, %</b>                         | 5.9                       | 14.0                      |
| <b>Dose Reduction/Drug Discontinuation, %</b>               | 9.9/7.9                   | 26/16                     |

**I reserve T-DXd for the 2<sup>nd</sup>-line setting**

Stay tuned for DESTINY-Lung04!

# Discussion Question

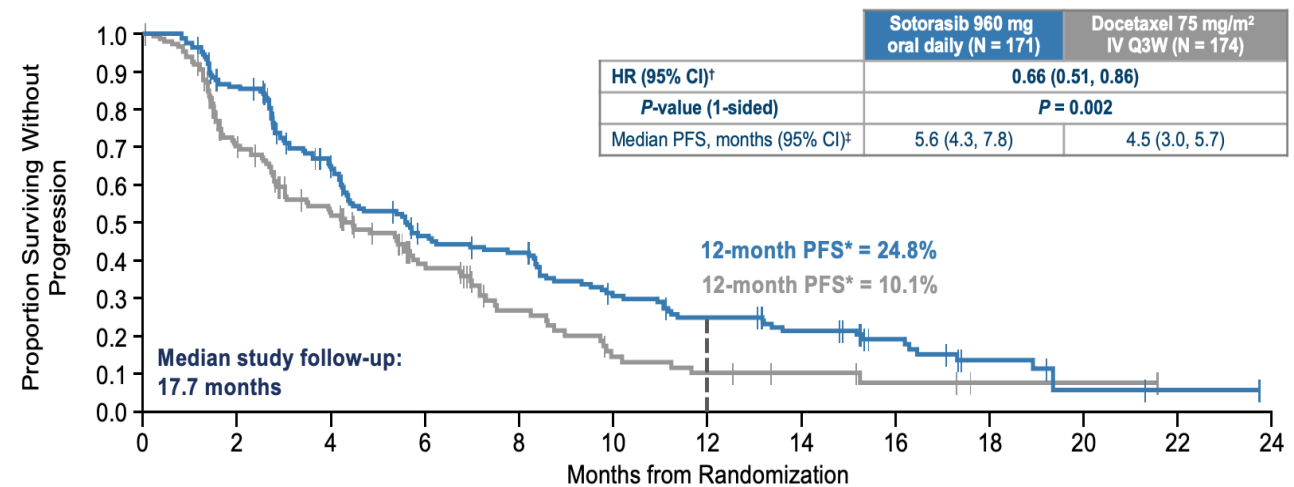

**In which line of treatment do you administer targeted therapy to your patients with metastatic NSCLC and KRAS G12C mutations? How do you select between sotorasib and adagrasib?**

# Management of KRAS G12C-mutant NSCLC

- Sotorasib and Adagrasib have comparable antitumor activity. We don't have head-to-head studies but the safety profile of Sotorasib is slightly more favorable.
- We have more data for Adagrasib in patients with (treated) brain metastases.
- I reserve Adagrasib and Sotorasib for the 2<sup>nd</sup>-line setting. I would consider prioritizing Adagrasib over Sotorasib in a patient with brain metastases. I tend to use Sotorasib for all others.

| Response & Toxicity         | <b>*Not A Formal Comparison</b> |                      |
|-----------------------------|---------------------------------|----------------------|
|                             | Sotorasib<br>n = 174            | Adagrasib<br>n = 112 |
| Confirmed ORR, n (%)        | 41                              | 48 (42.9)            |
| Disease Control Rate, n (%) | 84                              | 89 (79.5)            |
| Median PFS, months          | 6.3                             | 6.5                  |
| Median OS, months           | 12.5                            | 12.6                 |
| Intracranial ORR, %         | ---                             | 33                   |
| Dose Reduction, %           | 22.2                            | 51.7                 |
| Dose Discontinuation, %     | 7.1                             | 6.9                  |

## CodeBreak 200: Sotorasib vs Docetaxel

Number of Patients at Risk:

|           | 171 | 139 | 93 | 63 | 56 | 38 | 30 | 24 | 14 | 6 | 2 | 1 | 0 |
|-----------|-----|-----|----|----|----|----|----|----|----|---|---|---|---|
| Sotorasib | 171 | 139 | 93 | 63 | 56 | 38 | 30 | 24 | 14 | 6 | 2 | 1 | 0 |
| Docetaxel | 174 | 93  | 62 | 36 | 20 | 10 | 7  | 5  | 3  | 1 | 1 | 0 | 0 |

ORR: 28.1% vs 13.2%, Median DOR: 8.6 vs 6.8 mo

Overall Survival: 10.6 vs 11.3 mo (not statistically significant)
