SABCS 2003;Abstract 4.

GENERAL SESSION 1 | WEDNESDAY, DECEMBER 3 | 10:15 AM CT

Final Overall Survival Analysis from the MONARCH 3 Study of Abemaciclib to be Presented at the 2023 San Antonio Breast Cancer Symposium

Press Release – December 5, 2023

Results from the MONARCH 3 clinical trial will be presented in a late-breaking presentation during the 2023 San Antonio Breast Cancer Symposium (SABCS).

"MONARCH 3 evaluated abemaciclib in combination with an aromatase inhibitor (AI) compared to an AI alone as initial endocrine-based therapy for post-menopausal patients with hormone receptor positive (HR+), human epidermal growth factor receptor 2 negative (HER2-) advanced or metastatic breast cancer. At eight years of follow-up, MONARCH 3 showed women taking abemaciclib and an AI had a median overall survival (OS) of more than 5.5 years – an increase of 13.1 months compared to the control arm in the intent-to-treat (ITT) population (66.8 vs 53.7 months), although statistical significance for the OS outcome was not reached (HR, 0.804; 95% CI, 0.637-1.015; p = 0.0664).

For women with visceral organ metastases, data showed a median OS of more than five years, with an increase in median OS of 14.9 months in the abemaciclib arm compared to the control arm (63.7 vs 48.8 months). [...] Patients with visceral disease are at an increased risk of disease progression and death compared to metastatic breast cancer (MBC) patients without visceral metastases. The OS results for this subpopulation were also not statistically significant (HR, 0.758; 95% CI, 0.558-1.030; p = 0.0757)."

Positive Phase III Results for Inavolisib Combination in People with Advanced Hormone Receptor-Positive, HER2-Negative Breast Cancer with a PIK3CA Mutation

Press Release – December 5, 2023

Positive results were announced from the Phase III INAVO120 study of the investigational therapy inavolisib in combination with palbociclib and fulvestrant as a potential first-line treatment option for people with PIK3CA-mutated, hormone receptor-positive, HER2-negative, endocrine-resistant, locally advanced or metastatic breast cancer.

"The study met its primary endpoint of progression-free survival (PFS), demonstrating a statistically significant and clinically meaningful improvement compared to palbociclib and fulvestrant alone. Overall survival data were immature at this time, but a clear positive trend has been observed. Follow-up will continue to the next analysis. [...]

The inavolisib combination was well tolerated and adverse events were consistent with the known safety profiles of the individual study treatments, with no new safety signals observed."

Mayer et al. SABCS 2022. Abstract GS3-06.
AE, adverse event; CDK, cyclin-dependent kinase; CTC, circulating tumor cells; ctDNA, circulating tumor DNA; ET, endocrine therapy; HER2, human epidermal growth factor receptor; HR, hormone receptor; ITT, intent to treat; MBC, metastatic breast cancer; ORR, objective response rate; OS, overall survival; PFS, progression-free survival.

PALMIRA Study Design (NCT03809988)

Key Eligibility Criteria

1. Patients with HR[+]/HER2[-] ABC*
2. PD on a 1L of palbociclib plus ET (AI or fulvestrant) after clinical benefit, or
   - PD on palbociclib–based adjuvant regimen after at least 12 months of treatment but no more than 12 months following completion
3. No other prior treatment for ABC

Stratification Factors

- Prior ET (fulvestrant *vs.* AIs)
- Site of disease (visceral *vs.* non-visceral)

R 2:1 N = 198

N = 136

- **Fulvestrant‡** 500 mg IM, on day 1, 15, 29 and monthly thereafter
- OR
- **Letrozole‡** 2.5 mg PO, once daily, continuously
- ✚
- **Palbociclib†** 75/100/125 mg PO, once daily, 3 weeks on, 1 week off

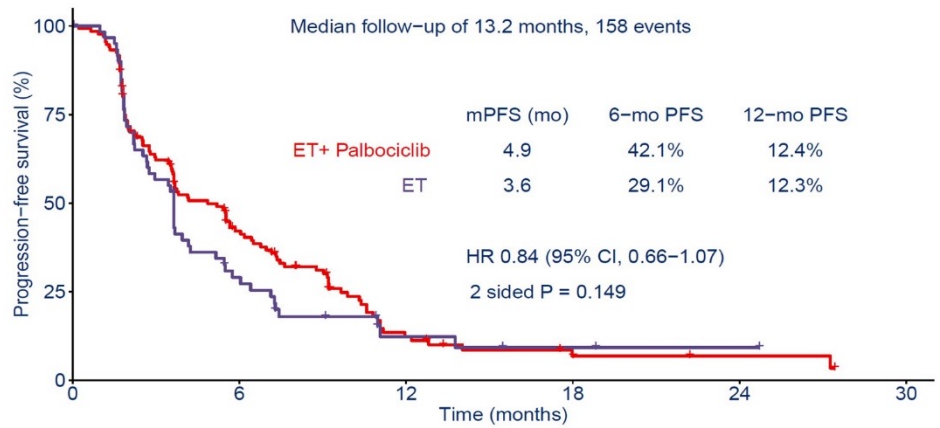
N = 62

- **Fulvestrant‡** 500 mg IM, on day 1, 15, 29 and monthly thereafter
- OR
- **Letrozole‡** 2.5 mg PO, once daily, continuously

→ **Treatment until progressive disease, unacceptable toxicity, or study withdrawal**

1L: First–line; ABC: Advanced breast cancer; AI: Aromatase inhibitors; ET: Endocrine therapy; HER2[-]: Human Epidermal Growth Factor Receptor 2-negative; HR[+]: Hormone receptor-positive; IM: Intramuscular injection; PO: oral administration; PD: Progressive disease; R: Randomization.
*If pre-menopausal, ovarian function suppression method required.
†Palbociclib dose could be reduced until 75 mg. If a dose reduction below 75 mg is required, treatment must be discontinued.
‡Administration of endocrine therapy was chosen depending on the prior administered agent.

Primary Objective: Investigator-assessed PFS (ITT Population)



CI: Confidence interval; HR: Hazard ratio; ITT: Intention to treat; mo: Months; mPFS: Median progression-free survival; PFS: Progression-free survival.

Llombart-Cussac et al. ASCO 2023. Abstract 1001.

2022 ASCO ANNUAL MEETING

A randomized phase II trial of fulvestrant or exemestane with or without ribociclib after progression on anti-estrogen therapy plus cyclin-dependent kinase 4/6 inhibition in patients with unresectable or metastatic hormone receptor positive, HER2 negative breast cancer: MAINTAIN Trial

Schema

Key Entry Criteria
- Men or Women age ≥ 18 yrs
- ER and/or PR ≥ 1%, HER2- MBC
- Progression on ET + any CDK 4/6 inhibitor
- ≤ 1 line of chemotherapy for MBC
- Measurable or non-measurable
- PS 0 or 1
- Postmenopausal
  - GnRH agonist allowed if premenopausal
- Stable brain metastases allowed

1:1, N=120

Arm 1
Ribociclib + Switch Endocrine Therapy*

Arm 2
Placebo + Switch Endocrine Therapy*

Primary Endpoint
- Progression free survival
  - Locally assessed per RECIST 1.1

Secondary Endpoints
- Overall response rate
- Clinical benefit rate
- Safety
- Tumor and blood markers, including circulating tumor DNA

- Fulvestrant as endocrine therapy in pts with progression on a prior aromatase inhibitor for MBC and no prior fulvestrant; Protocol amended to allow exemestane as endocrine therapy if progression on prior fulvestrant (September 2018); Ribociclib 600 mg administered 3 weeks on/1 week off

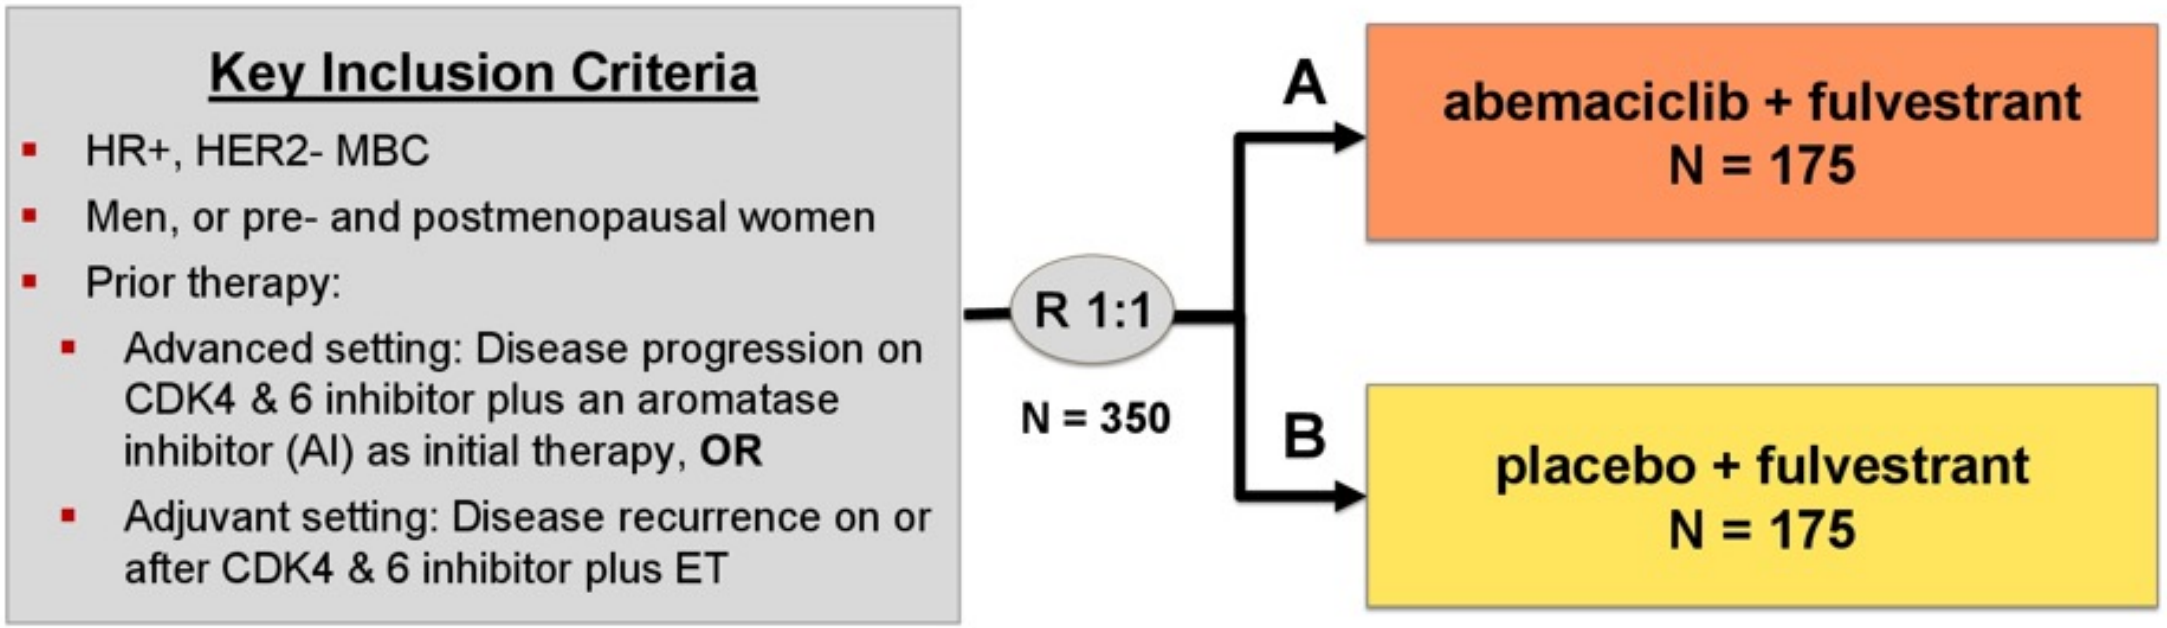
#ASCO22 PRESENTED BY: Kevin Kalinsky, MD, M Abstract LBA1004 ASCO AMERICAN SOCIETY OF CLINICAL ONCOLOGY KNOWLEDGE CONQUERS CANCER

Primary Endpoint: Progression Free Survival (PFS)

	Placebo + ET (n=59)	Ribociclib + ET (n=60)
Median: 95% CI (months)	**2.76** (2.66-3.25)	**5.29** (3.02-8.12)

Kalinsky et al. *J Clin Oncol* 2023;41(24):4004-13.

Ongoing postMONARCH study (NCT05169567; PI: Kalinsky)



Conclusions

First line CDK4/6i should be considered SOC

CDK after CDK: let's wait for more data

Agenda

Module 1: Optimal Integration of CDK4/6 Inhibitors into the Management of ER-Positive Metastatic Breast Cancer (mBC) — Dr Kaklamani

Module 2: Novel Strategies to Overcome Resistance to Endocrine Therapy — Dr Jhaveri

Module 3: Current Role of Antibody-Drug Conjugates in the Management of ER-Positive mBC — Dr Rugo

Module 4: Current and Future Role of Selective Estrogen Receptor Degraders (SERDs) in the Management of ER-Positive mBC — Prof Bidard

Module 5: Novel Therapies Under Investigation for Patients with ER-Positive mBC — Dr Hamilton

A 65-year-old woman with ER-positive, HER2-negative, node-negative breast cancer has developed multiple metastases 2 years after starting adjuvant anastrozole. She receives a CDK4/6 inhibitor with fulvestrant and initially responds but then experiences disease progression 18 months later. Regulatory and reimbursement issues aside, what would be your most likely next treatment if biomarker evaluation results were as follows?

A 65-year-old woman with ER-positive, HER2-negative, node-negative breast cancer has developed multiple metastases 2 years after starting adjuvant anastrozole. She receives a CDK4/6 inhibitor with fulvestrant and initially responds but then experiences disease progression 18 months later.

ESR1-positive **PIK3CA-negative** **AKT- and PTEN-negative**

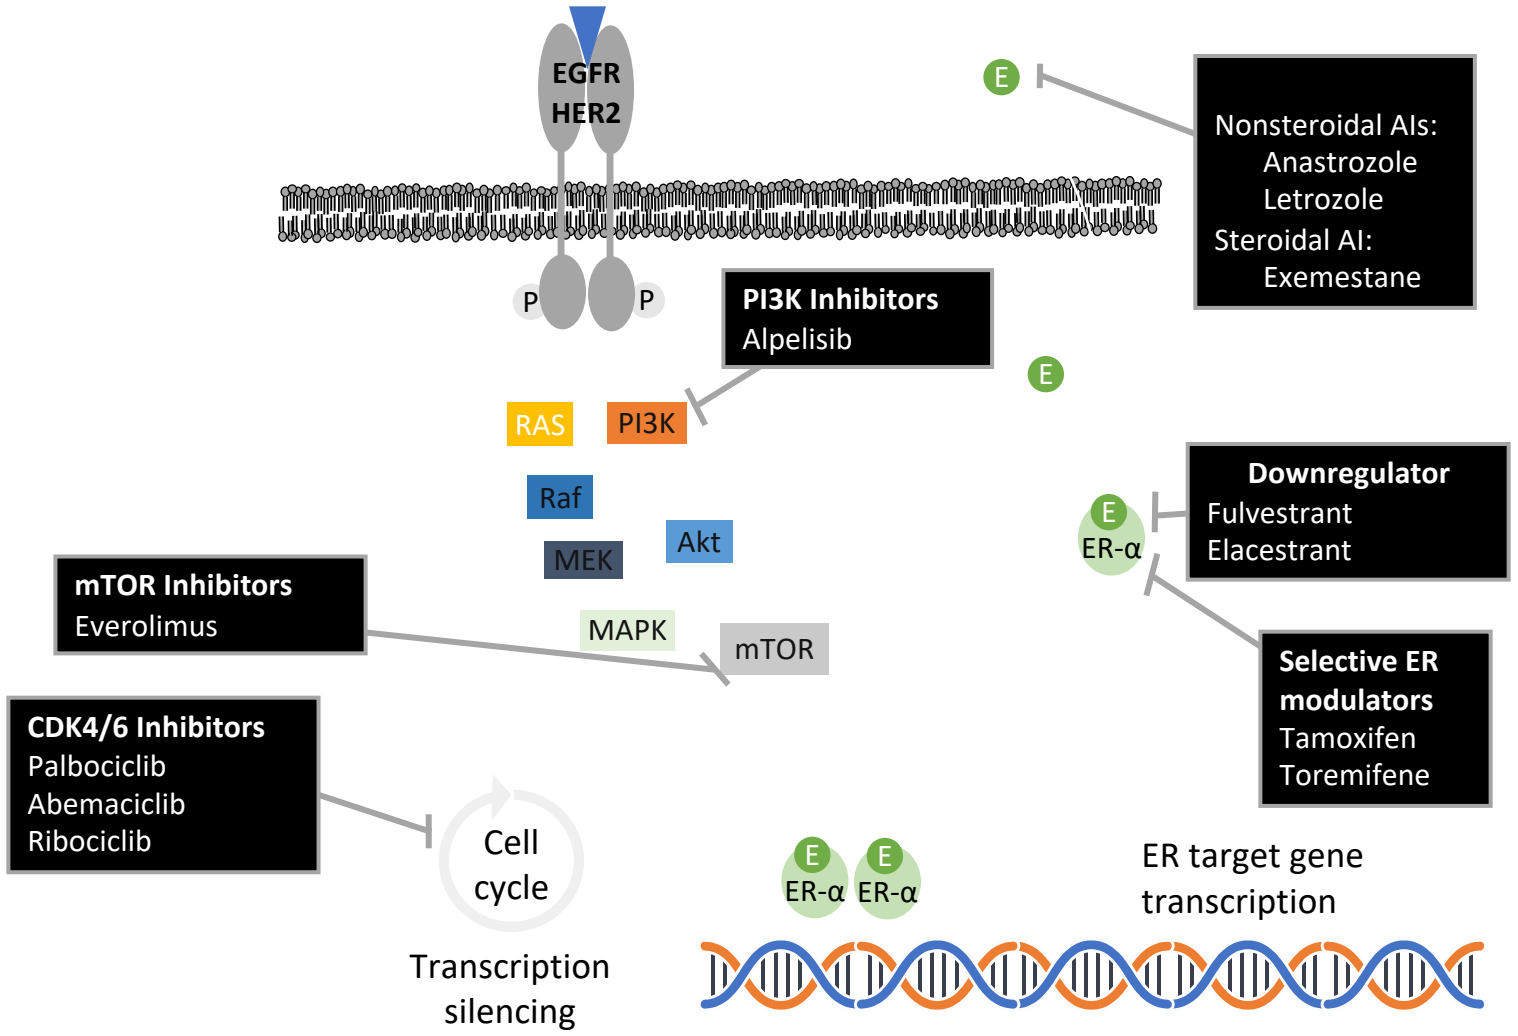
Targeted Strategies to Overcome Resistance in HR+/HER2- MBC



- **Mechanisms of Endocrine Resistance**
  - Alteration of cell survival and cell cycle pathways
  - Activation of growth factor signaling pathways
  - Deregulation of the ER pathway
- PI3K/AKT/mTOR pathway is frequently altered (~40%) in HR+ BC, implicated in resistance to endocrine therapies
- PI3K signaling promotes estrogen-independent growth of ER+ BC, and can be inhibited by the addition of agents targeting PI3K pathway to antiestrogens

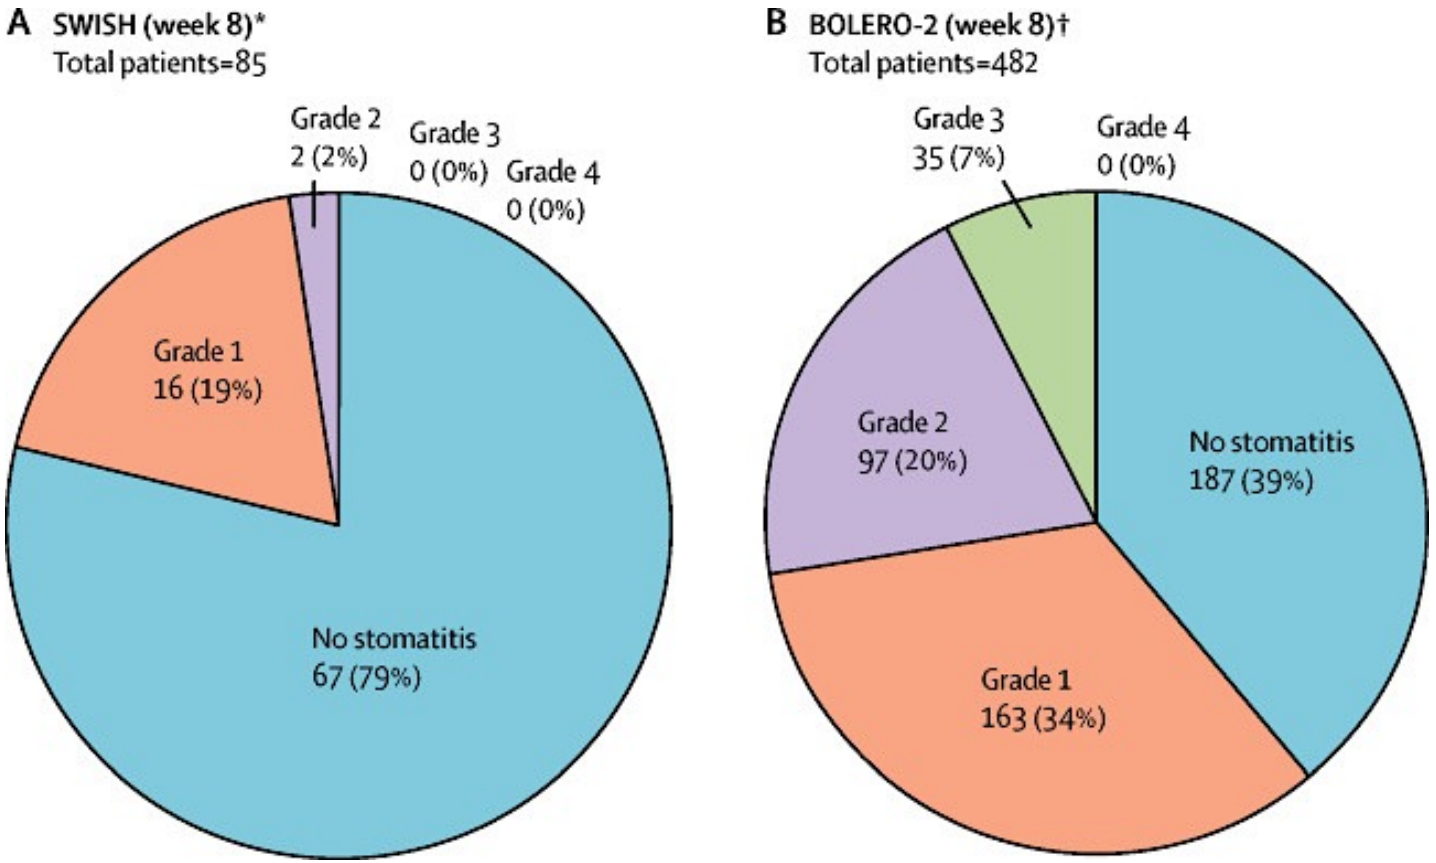
Discontinuation rate: 19% vs 4%

Baselga et al NEJM 2012

SWISH: Phase 2 Trial to Prevent Everolimus Related Stomatitis

Prophylactic use of dexamethasone oral solution substantially reduced the incidence and severity of stomatitis in patients receiving everolimus and exemestane

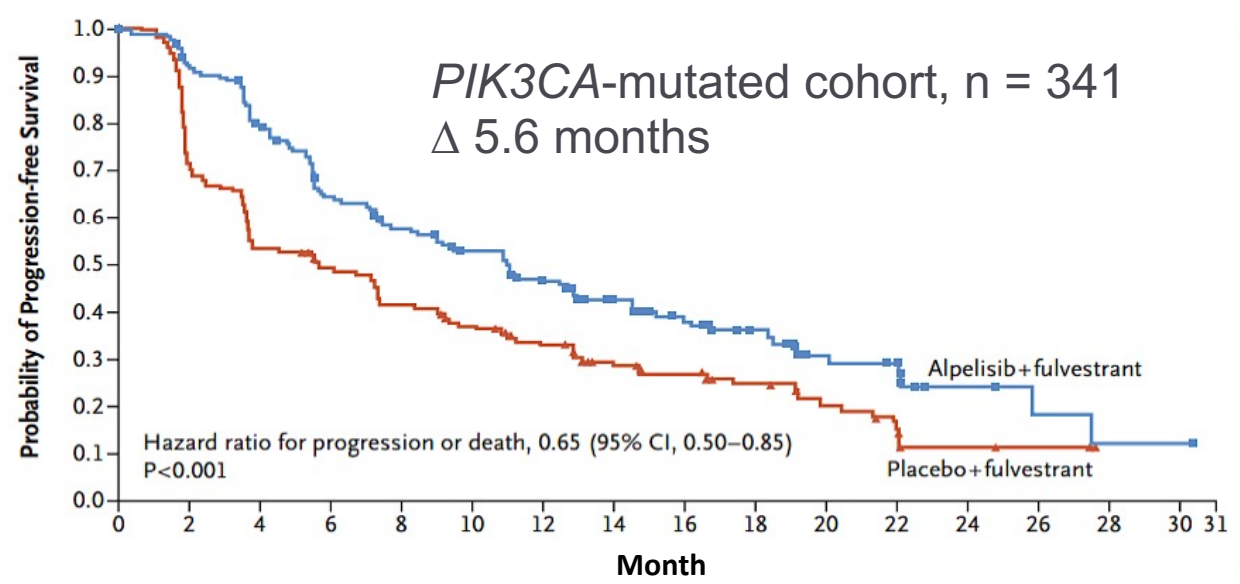


Rugo et al. Lancet Oncology 2017

Option for Patients Whose Tumors Harbor *PIK3CA* Mutations
Fulvestrant + *Alpelisib*

SOLAR-1 (Phase 3): Fulvestrant ± Alpelisib

(Progression on or after AI)



- Numerical improvement in median OS of 7.9 months in the mutated cohort[b]
- Discontinuation rate was 25% in FUL + ALP arm vs 4.2% in the FUL arm[a]
- Most common side effects (grade 3): hyperglycemia (36%), rash (10%), and diarrhea (7%)[a]
- **6% had prior CDK4/6 inhibitor**

Median PFS[a]

- 11.0 months (ALP + FUL) vs 5.7 months (FUL)
- HR = 0.65 (95% CI: 0.50, 0.85); *P* < .001

- ALP, alpelisib; FUL, fulvestrant.

a. Andre F, et al. N Engl J Med. 2019;380:1929-1940; b. Andre F, et al. Ann Oncol. 2021;32:208-217

SOLAR-1: Adverse Events of Alpelisib

AEs ≥20% in Either Arm, n (%)	Alpelisib + Fulvestrant (n = 284)			Placebo + Fulvestrant (n = 287)		
	All	Grade 3	Grade 4	All	Grade 3	Grade 4
Any AE	282 (99.3)	183 (64.4)	33 (11.6)	264 (92.0)	87 (30.3)	15 (5.2)
Hyperglycemia	181 (63.7)	93 (32.7)	11 (3.9)	28 (9.8)	1 (0.3)	1 (0.3)
Diarrhea	164 (57.7)	19 (6.7)	0	45 (15.7)	1 (0.3)	0
Nausea	127 (44.7)	7 (2.5)	0	64 (22.3)	1 (0.3)	0

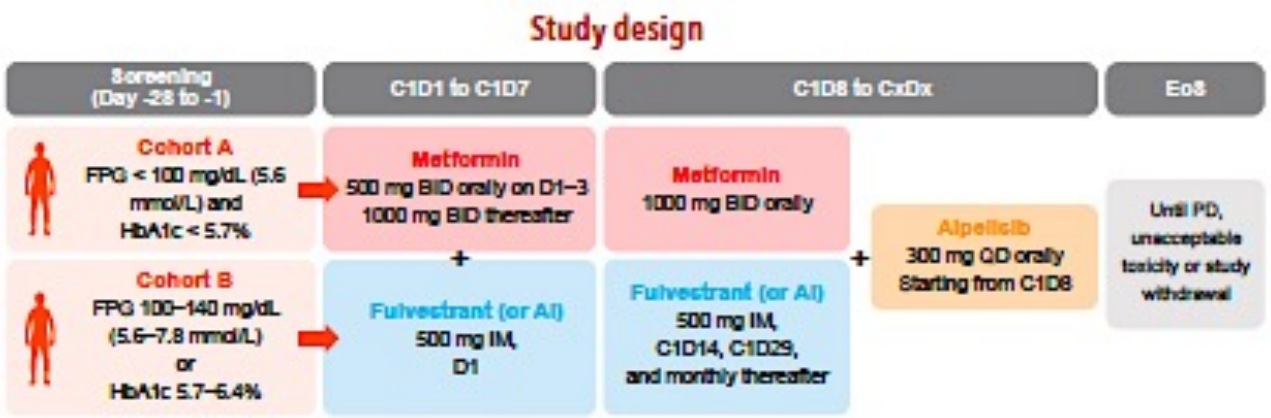
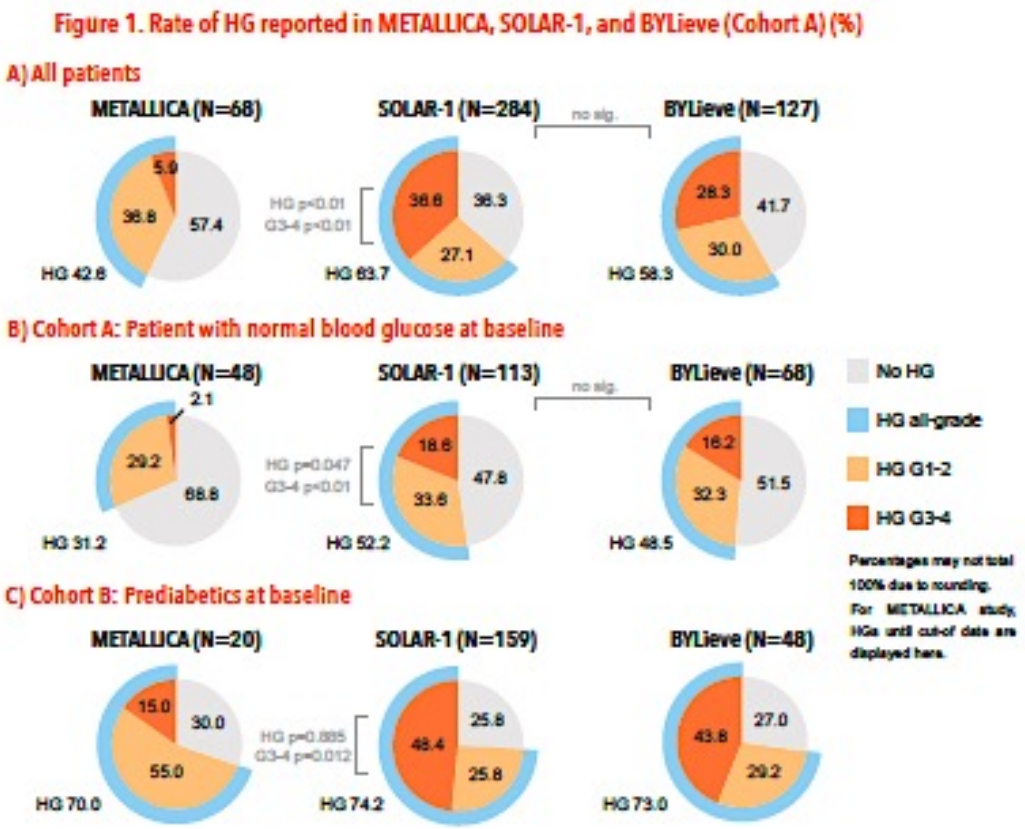
METALLICA Study:
Metformin prophylaxis to prevent hyperglycemia with alpelisib



- Use of prophylactic metformin substantially reduced incidence of severe hyperglycemia with alpelisib exposure
- G3 hyperglycemia 5.9% (METALLICA) versus 36.6% (SOLAR-1)



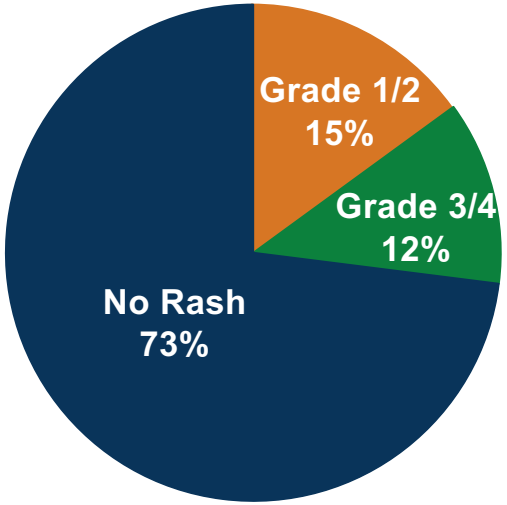
Llombart-Cussac et al, SABCS 2022

Understanding and Modifying Toxicity Associated With Alpelisib

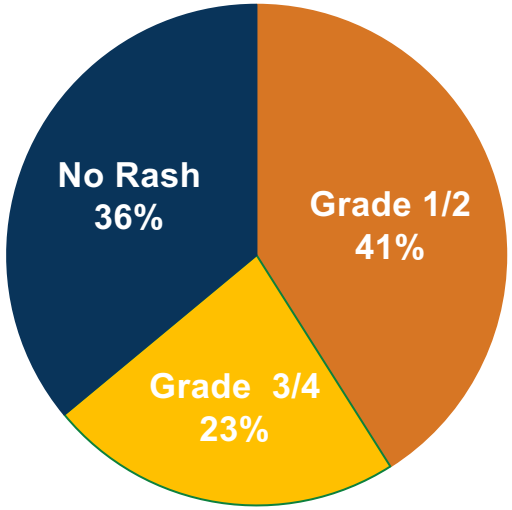
- In SOLAR-1, median time to onset for grade ≥3 rash: 13 days
- Discontinuation rate due to any grade rash: 3.2%

- For patients who received alpelisib + fulvestrant, antihistamine prophylaxis reduced rash
  - Of patients who received anti-rash prophylaxis
    - 69.8% received antihistamines
    - Rash occurred in 26.7% with prophylaxis and 64.1% without
    - Grade 3/4 incidence reduced by 50%

Alpelisib + Fulvestrant
Prophylactic Anti-rash Medication
(n = 86)



Alpelisib + Fulvestrant
No Prophylactic Anti-rash Medication
(n = 198)



Rugo et al Ann Oncology 2020

How can we harness the power of PIK3CA inhibition with improved tolerability?

- WT PI3Kα inhibition leads to dose-limiting toxicities, which may limit efficacy
  - -Hyperglycemia (65% all gr)
  - -Diarrhea (60% all gr)
  - -Rash (36% all gr)

- Selective targeting of oncogenic PI3K activation without inhibiting normal PI3K function in host tissues may improve therapeutic index

Agent	Trial

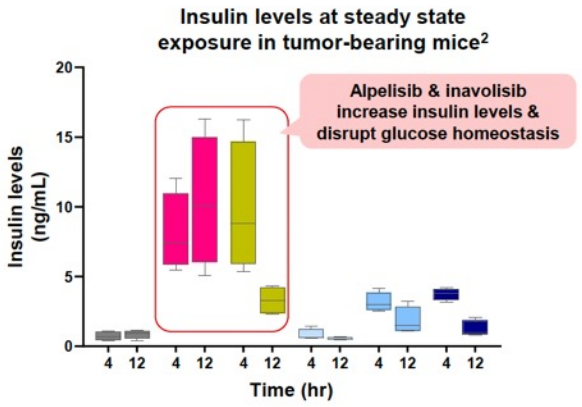
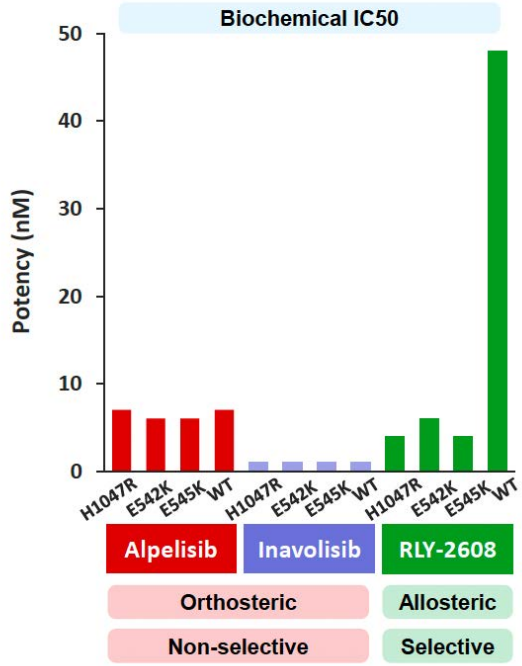
ReDiscover: First-in-Human Study of RLY-2608

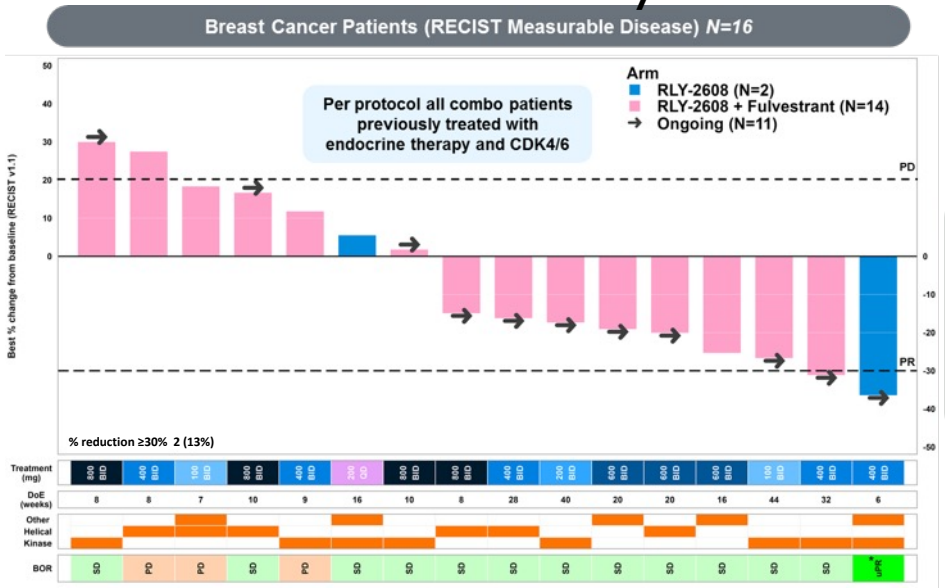
Minimal perturbation of insulin levels



RLY-2608 selectively inhibits mutant PI3Kα



Efficacy



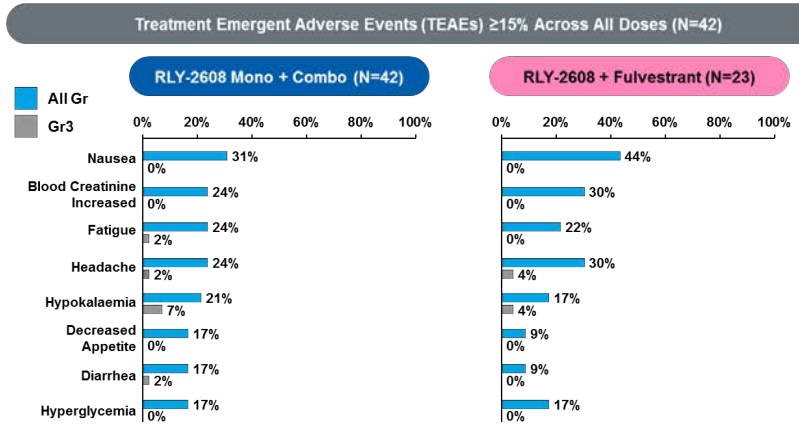
56% of patients (9/16) exhibit radiographic tumor reductions

81% of patients (13/16) with SD/uPR* across genotypes

11/16 patients ongoing

Median duration on treatment: 16 weeks

Safety



AEs leading to alpelisib discontinuation observed with RLY-2608
(for 400mg BID mono, ≥600mg BID combo; N=17)

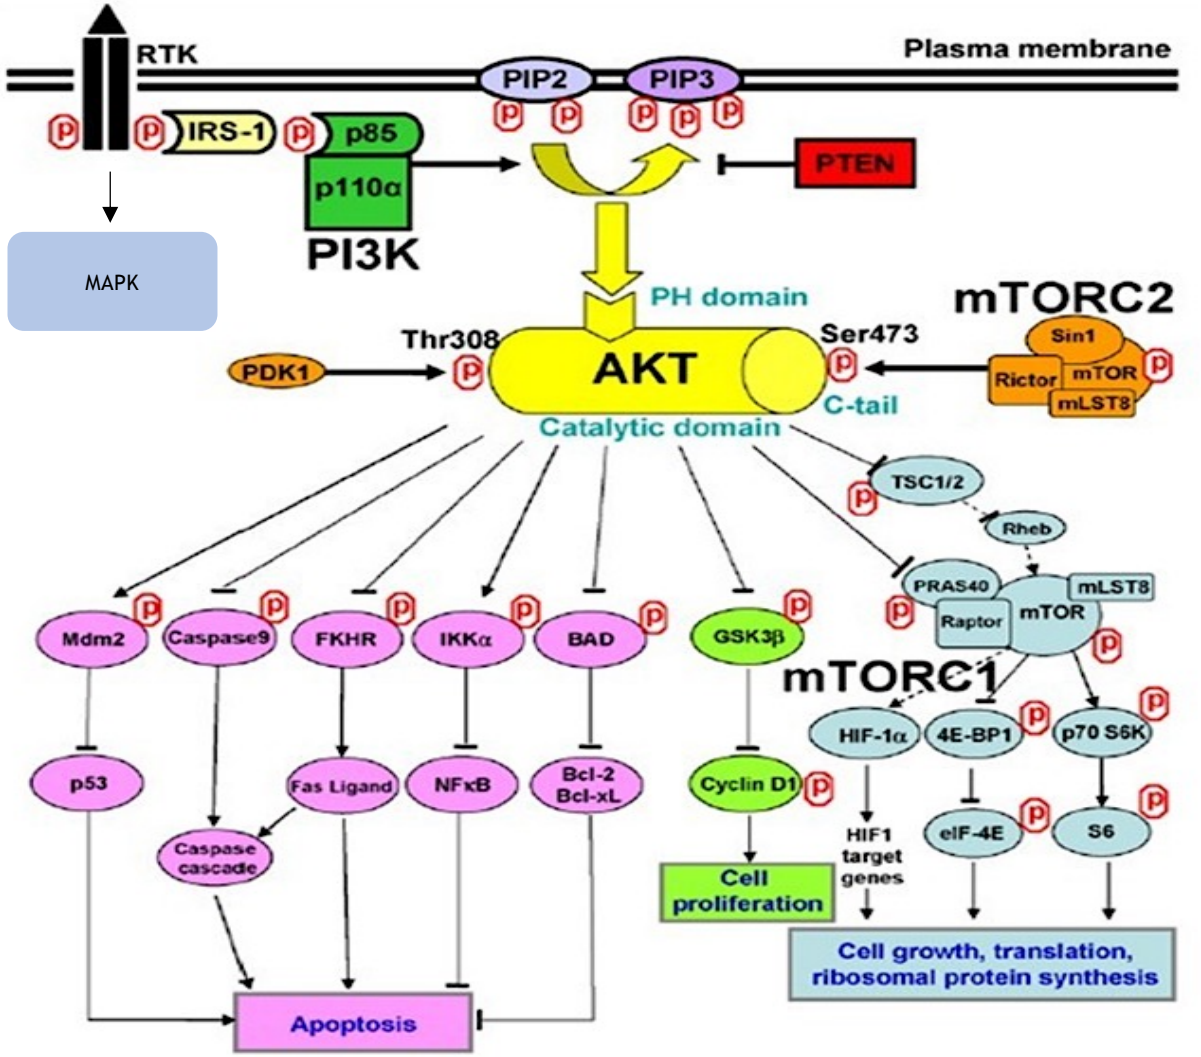
AE	All Gr (Gr3+)
Hyperglycemia	18% (0%)
Diarrhea	0%
Rash	12% (0%)

Most AEs low grade, manageable, reversible
Grade 3 TEAEs 10/42 (24%); No Grade 4-5 AEs
Dose modifications due to AE: Interruptions 31%; Reductions 2%; Discontinuations 0%
Median Relative Dose Intensity: 98%

NCT05216432

Varkaris et al AACR 2023

AKT is a central node in PI3K/Akt/mTOR pathway



Source data: TCGA; except *SU23/PCF Dream Team

Tumour type	PIK3CA mutation (%)	PTEN mutation or loss (%)	AKT1 mutation (%)
Breast	35	11	3
Prostate (metastatic)*	5	40	1
Bladder	22	9	1
Endometrial	53	66	2
Glioblastoma	9	30	<1
Head and Neck	18	2	<1
Lung: squamous	11	18	<1
Gastric-esophageal	5	9	1
Ovarian	<1	6	<1

- **AKT is a central node in the PI3K-AKT-mTOR pathway**
- **Pathway activated by multiple mechanisms (tumour-dependent),**
  - **activating mutations in *PIK3CA* (PI3K catalytic sub-unit) and *AKT1*;**
  - **loss of function alterations in *PTEN***
- **AKT activation mediates resistance to inhibitors of RTKs, anti-hormonal agents and chemotherapy**

Yap TA, et al. Curr Opin Pharmacol 2008; 8(4):393-412; Manning BD and Toker A. Cell. 2017;169(3):381-405

Capivasertib in Advanced ER+ Breast Cancer: Phase 2 FAKTION Trial

- >50% of ER+ MBC tumours have activated PI3K/AKT/PTEN pathway
- Capivasertib is a potent and selective inhibitor of all 3 isoforms of AKT
- In Phase II FAKTION trial, addition of capivasertib to fulvestrant doubled median PFS (10.3 vs 4.8 mo, HR 0.58)

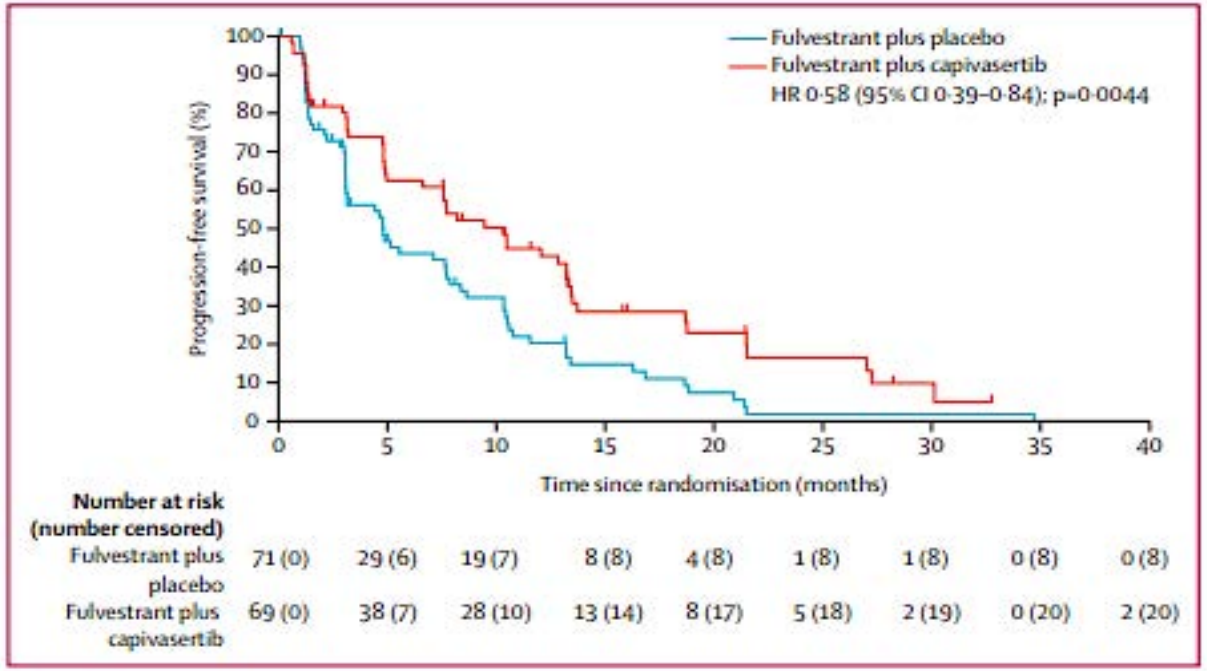


Figure 2: **Progression-free survival**
HR=hazard ratio.

	Fulvestrant + Placebo (n=28)	Fulvestrant + Capivasertib (n=31)
Median (95% CI)	5.2 months (3.1 to 8.4)	9.5 months (6.6 to 13.7)
Hazard Ratio	0.59 (0.34 to 1.03)	2-sided p=0.064

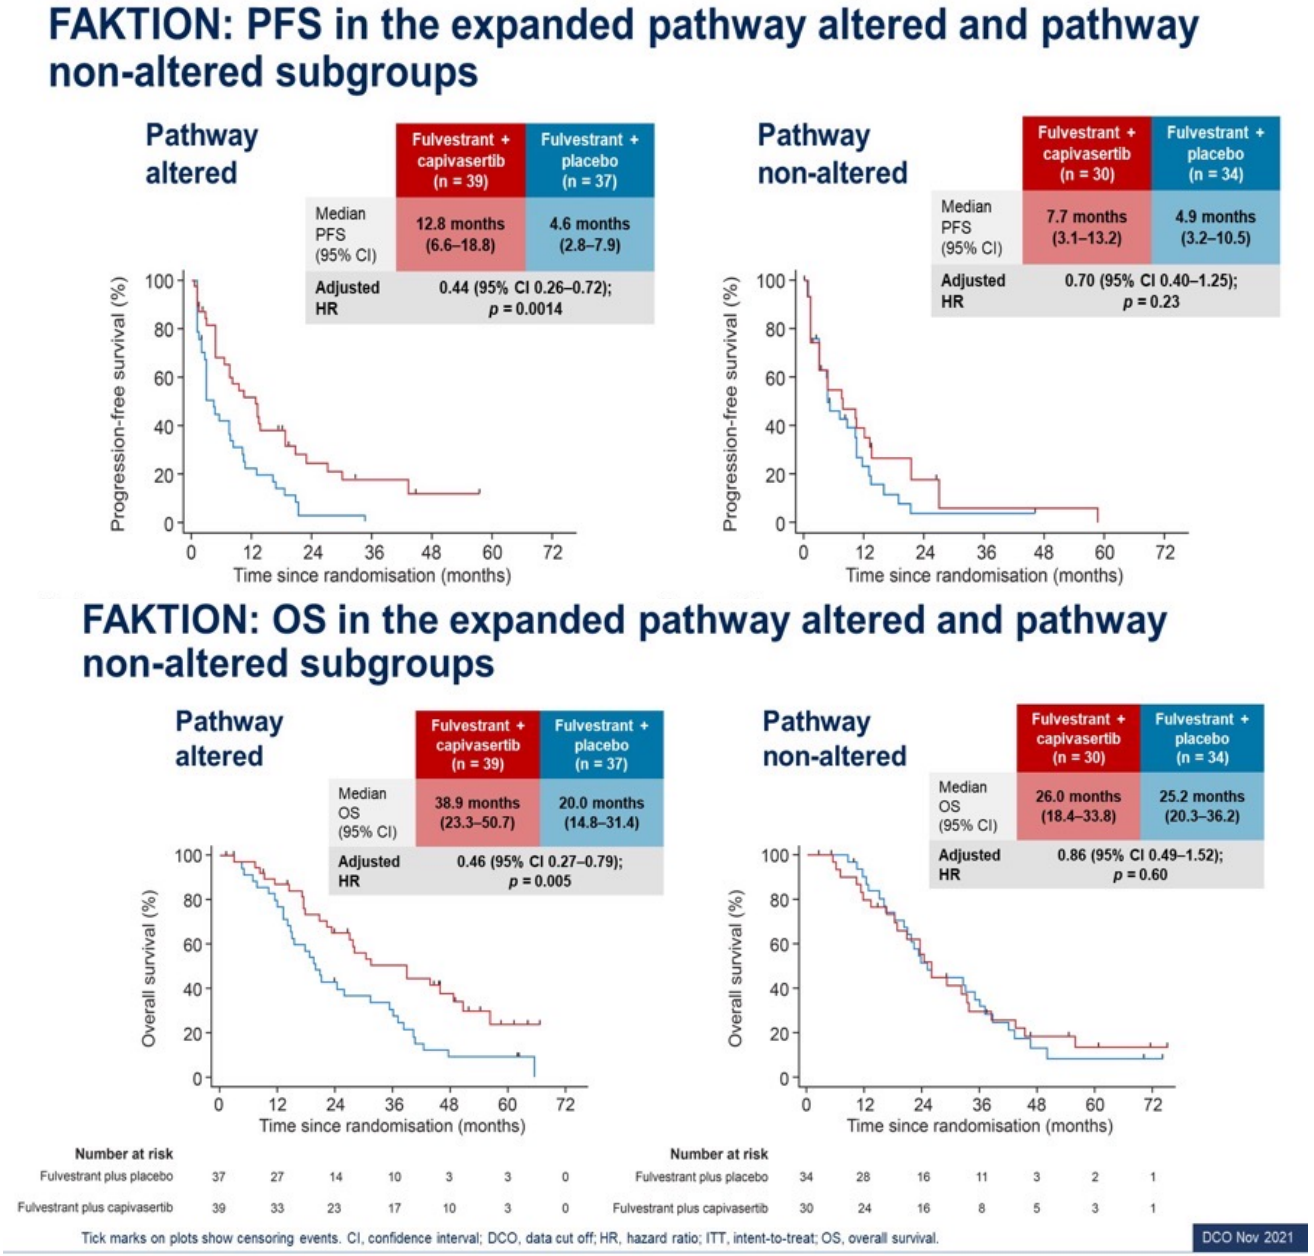
	Fulvestrant + Placebo (n=43)	Fulvestrant + Capivasertib (n=38)
Median (95% CI)	4.8 months (3.0 to 8.6)	10.3 months (3.2 to 13.2)
Hazard Ratio	0.56 (0.33 to 0.96)	2-sided p=0.035

- Benefit appeared independent of activated pathway, albeit only tested for limited *PIK3CA* mutations by ddPCR and PTEN protein loss by IHC
- *AKT1* not examined

Jones RL et al, Lancet Oncol 2020;21:345-57

Capivasertib in Advanced ER+ Breast Cancer: Phase 2 FAKTION Trial

- Updated efficacy data after median 60 mo follow-up
- Expanded NGS testing used to identify *AKT1* E17K mutation, additional activating *PIK3CA* mutations, and *PTEN* alterations predicted to result in loss of function
- PI3K/AKT/PTEN alterations found in 54% of participants in ITT population (vs 42% using original ddPCR / IHC methods)
- PFS and OS data indicated that capivasertib mainly benefited the pathway altered subgroup
  - Median PFS 12.8 mo vs 4.6 mo (HR 0.44; p = 0.0014)
  - Median OS 39.8 mo vs 20.0 mo (HR 0.46; p = 0.005)



Howell S et al, Lancet Oncol 2022

CAPItello-291: A Global Phase 3 Randomized, Double-Blind, Placebo-Controlled Trial of Patients with HR+/HER2− aBC or mBC Following Recurrence or Progression On or After AI-based Regimen[1,2]

Patients with HR+/HER2− aBC or mBC

- Men and pre-/post-menopausal women
- Recurrence or progression while on or <12 months from end of adjuvant AI, or progression while on prior AI for aBC or mBC
- ≤2 lines of prior endocrine therapy for aBC or mBC
- ≤1 line of chemotherapy for aBC or mBC
- Prior CDK4/6 inhibitors allowed (at least 51% required)
- No prior SERD, mTOR inhibitor, PI3K inhibitor, or AKT inhibitor
- HbA1c <8.0% (63.9 mmol/mol) and diabetes not requiring insulin allowed
- FFPE tumor sample from the primary/recurrent cancer available for retrospective central molecular testing

R1:1 (N=708)

Capivasertib	400 mg (two 200-mg tablets) twice daily, 4 days on, 3 days off, weekly
Fulvestrant	500 mg: Days 1, 15, 29 and once monthly thereafter
Placebo	Two tablets Twice daily, 4 days on, 3 days off, weekly
Fulvestrant	500 mg: Days 1, 15, 29 and once monthly thereafter

Stratification factors:
- Liver metastases (yes/no)
- Prior CDK4/6 inhibitor (yes/no)
- Region*

Dual primary endpoints

PFS by investigator assessment
- Overall population
- PI3K/AKT/PTEN pathway-altered tumors (≥1 qualifying *PIK3CA*, *AKT1*, or *PTEN* alteration)

Key secondary endpoints

- Overall survival
- Objective response rate
- Safety

HER2– was defined as IHC 0 or 1+, or IHC 2+/ISH–. *Region 1: United States, Canada, Western Europe, Australia, and Israel; Region 2: Latin America, Eastern Europe and Russia vs Region 3: Asia. Pre- or peri-menopausal women also received a luteinizing hormone-releasing hormone agonist for the duration of the study treatment.

- aBC, locally advanced breast cancer; AI, aromatase inhibitor; AKT, serine/threonine protein kinase; CDK4/6, cyclin-dependent kinase 4/6; FFPE, formalin-fixed, paraffin-embedded; HER2−, human epidermal growth factor receptor 2 negative; HR+, hormone receptor positive; mBC, metastatic breast cancer; mTOR, mammalian target of rapamycin; PI3K, phosphoinositide 3-kinase; PTEN, Phosphatase and tensin homolog; PFS, progression-free survival; SERD, selective estrogen receptor degrader.

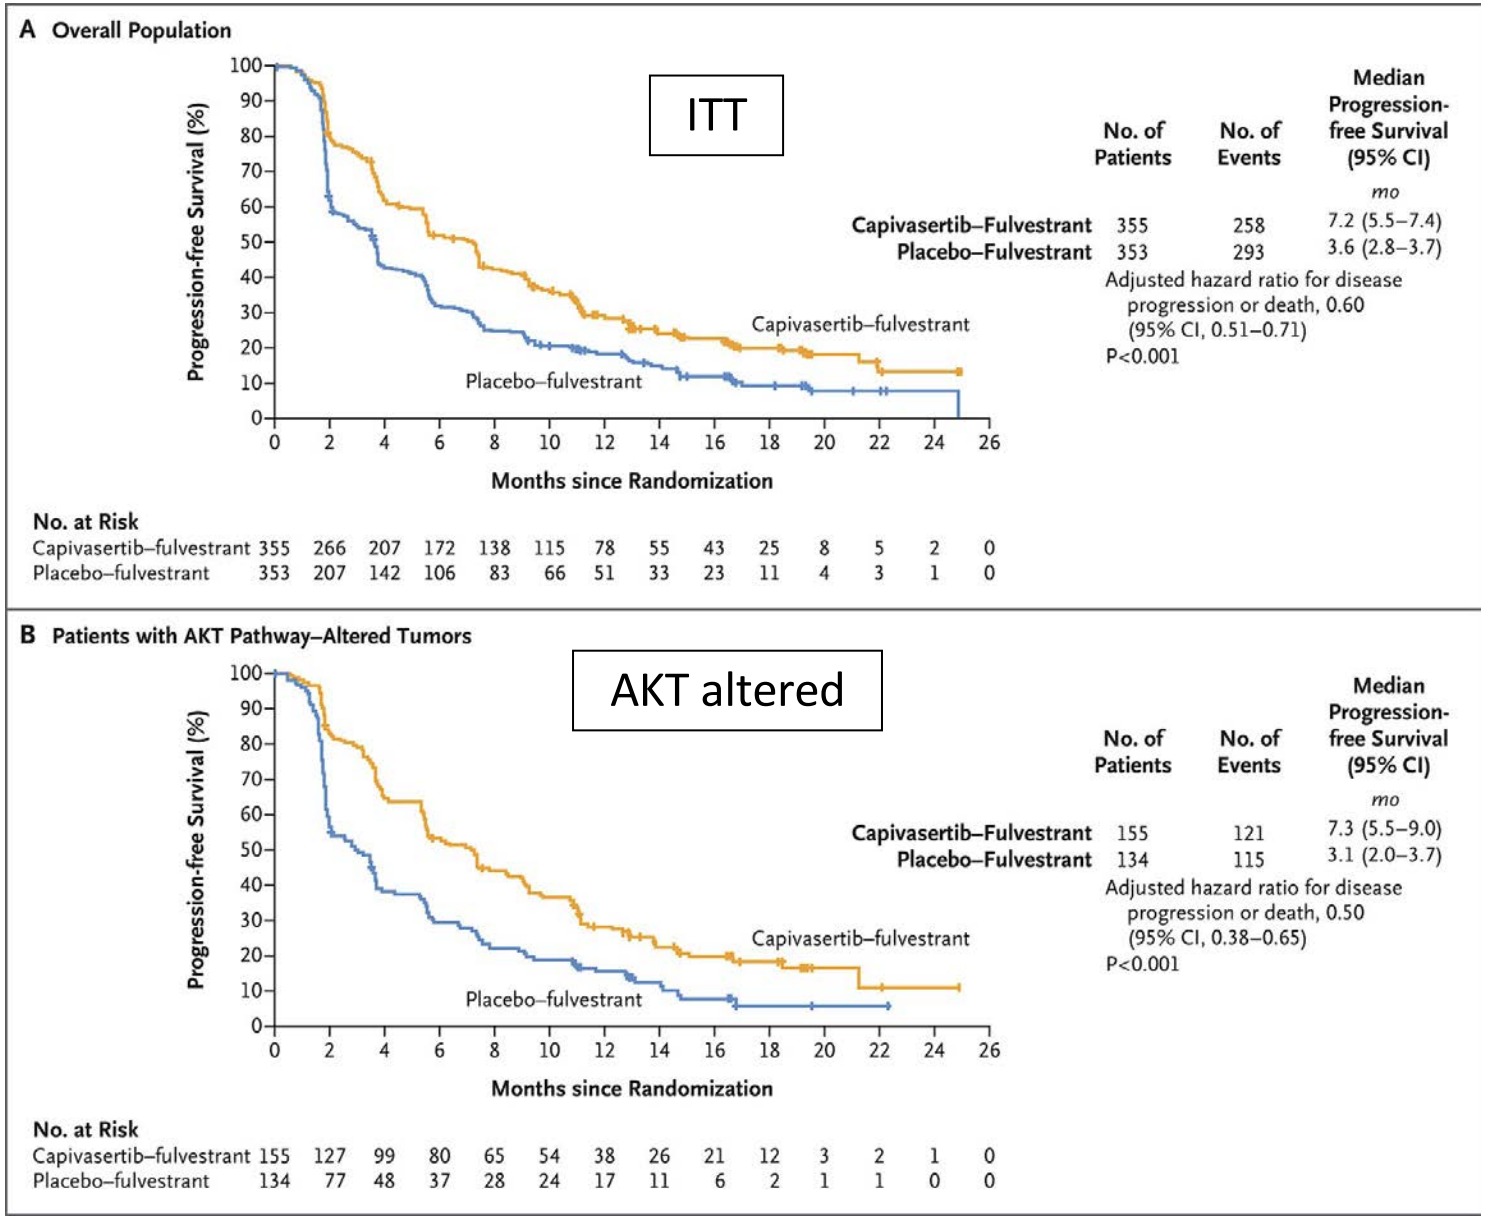
Turner NC et al. N Engl J Med. 2023;388(22):2058-2070

CAPItello-291:

- 69% prior CDK4/6i
- 18% prior chemotherapy
- Study met dual primary endpoints, showing significantly prolonged PFS with capivasertib + FULV vs placebo + FULV in overall and AKT pathway–altered populations (41% AKT altered)

  -HR 0.60 (ITT)

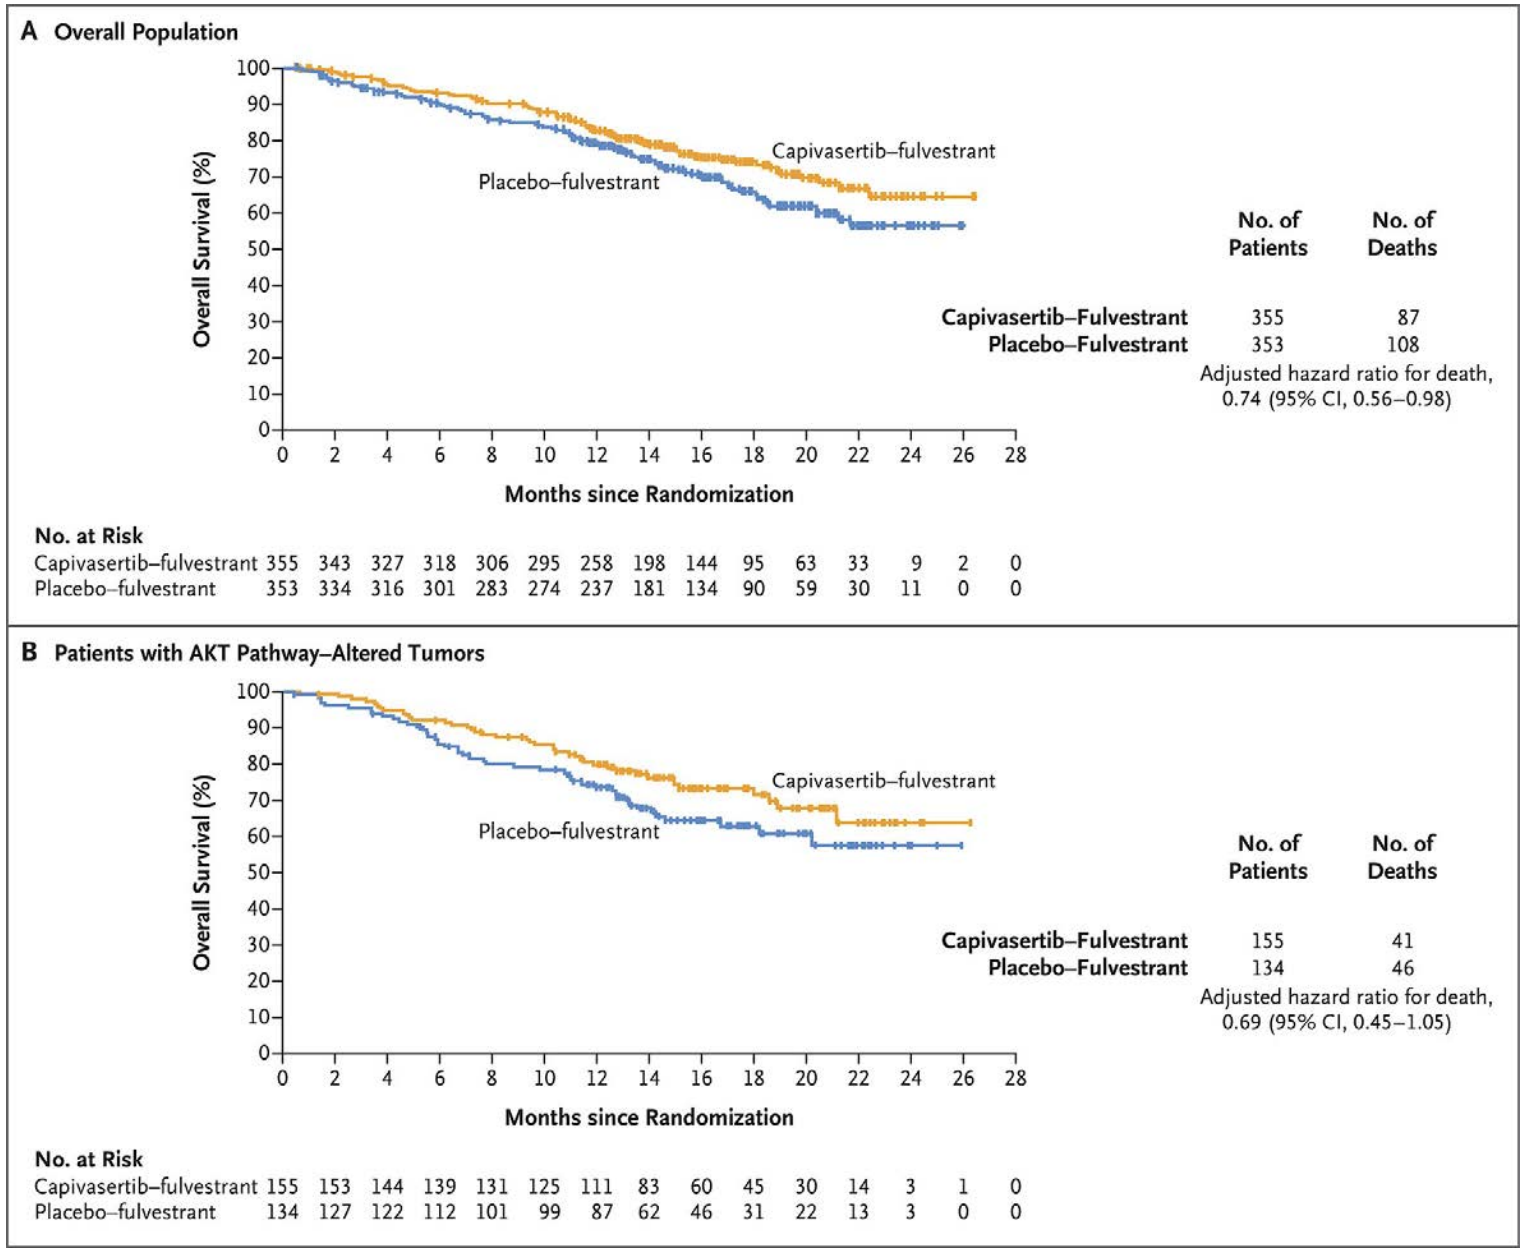
  -HR 0.50 (AKT altered)



Turner NC, et al. N Engl J Med. 2023;388(22):2058-2070.

OS in Overall Population and AKT-Pathway Altered

- OS is immature
- OS at 18 months:
  - Overall population: 73.9% capi vs. 65% placebo
  - AKT-pathway altered: 73.2% capi vs. 62.9% placebo

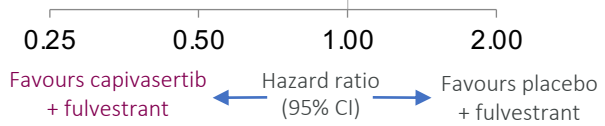


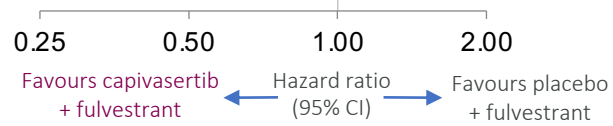
Turner NC, et al. N Engl J Med. 2023;388(22):2058-2070.

CAPItello-291: Summary of PFS by subgroups

Consistent benefit with capivasertib + fulvestrant was observed across clinically relevant subgroups in both the overall population and AKT pathway-altered population

		Overall population				AKT pathway-altered population			
			Median PFS, months				Median PFS, months		
		n	Capivasertib + fulvestrant	Placebo + fulvestrant		n	Capivasertib + fulvestrant	Placebo + fulvestrant	
Overall[a]		708	7.2	3.6		289	7.3	3.1	
Prior CDK4/6 inhibitor[b]	Yes	496	5.5	2.6		208	5.5	2.0	
	No	212	10.9	7.2		81	11.0	7.4	
Prior chemotherapy for ABC[b]	Yes	129	3.8	2.1		53	4.0	2.0	
	No	579	7.3	3.7		236	7.4	3.5	
Liver metastases at baseline[b]	Yes	306	3.8	1.9		123	5.5	1.8	
	No	402	9.2	5.5		166	9.1	3.7	





[a]HR was estimated using the Cox proportional hazard model stratified by the presence of liver metastases, prior use of CDK4/6 inhibitor, and geographic region. [b]HR was estimated using the Cox proportional hazard model stratified by the presence of liver metastases and geographic region (prior CDK4/6 inhibitor subgroup), the presence of liver metastases and prior use of CDK4/6 inhibitor (prior chemotherapy for ABC subgroup [overall population]) and prior use of CDK4/6 inhibitor only (prior chemotherapy for ABC subgroup [AKT pathway-altered population] and liver metastases subgroup).

Turner et al ESMO Breast 2023; Turner NC et al. N Engl J Med. 2023;388(22):2058-2070.

CAPItello-291: Efficacy

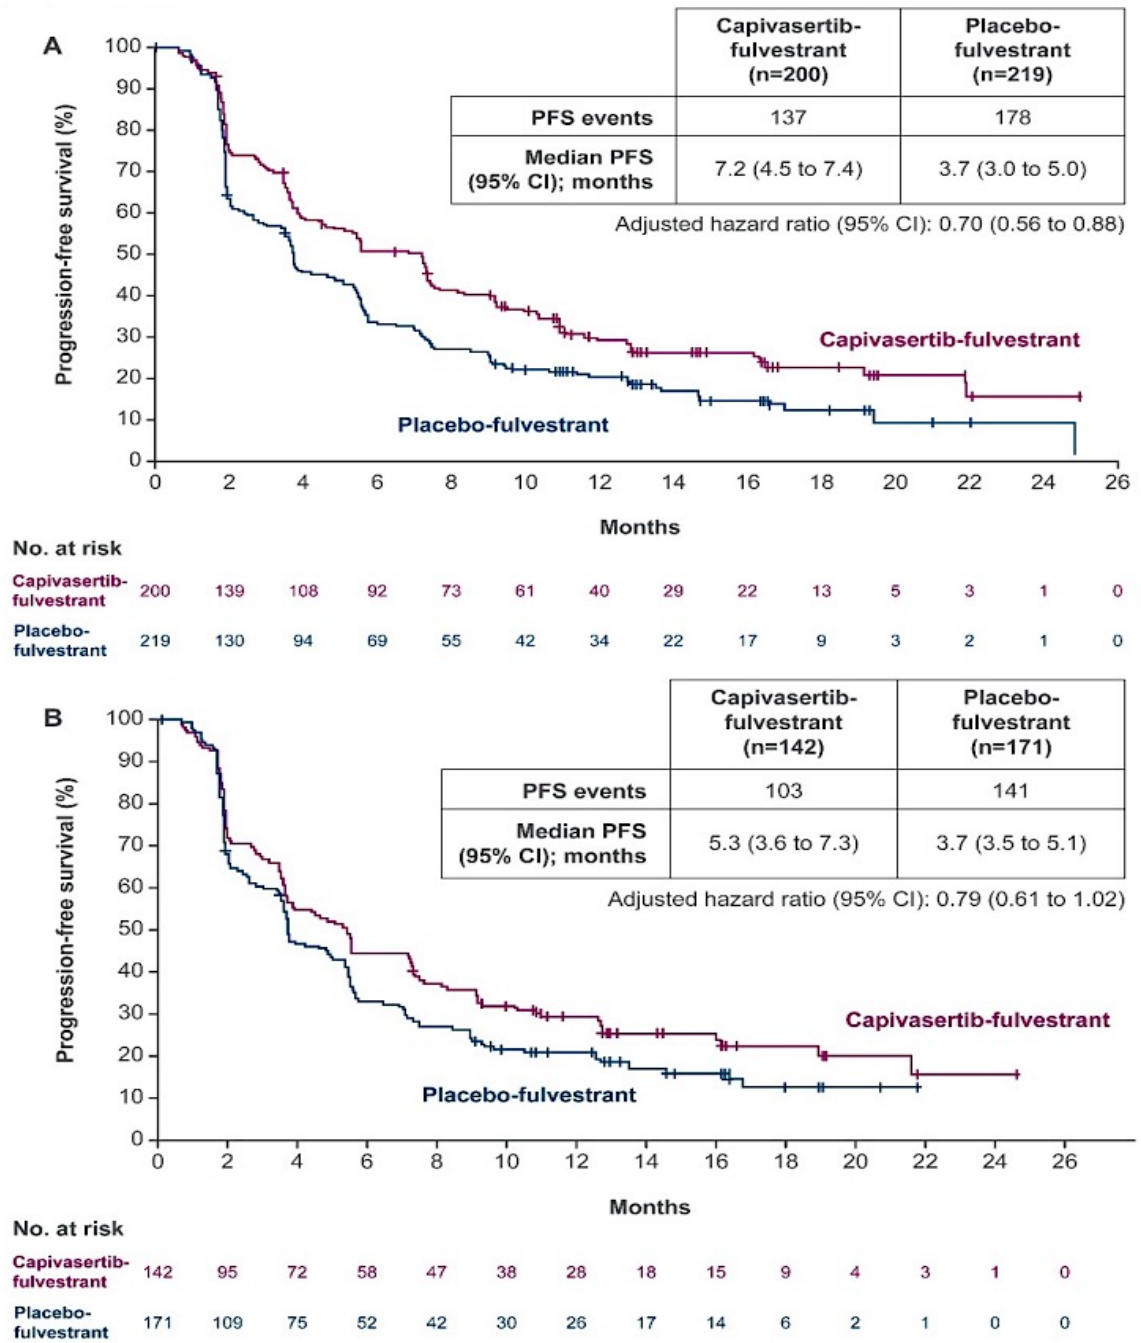
Exploratory Analyses

- 44% had alterations in *PIK3CA/PTEN/AKT*
- 16% unknown

PFS in patients with AKT pathway non-altered tumors, including unknown NGS result (per protocol)

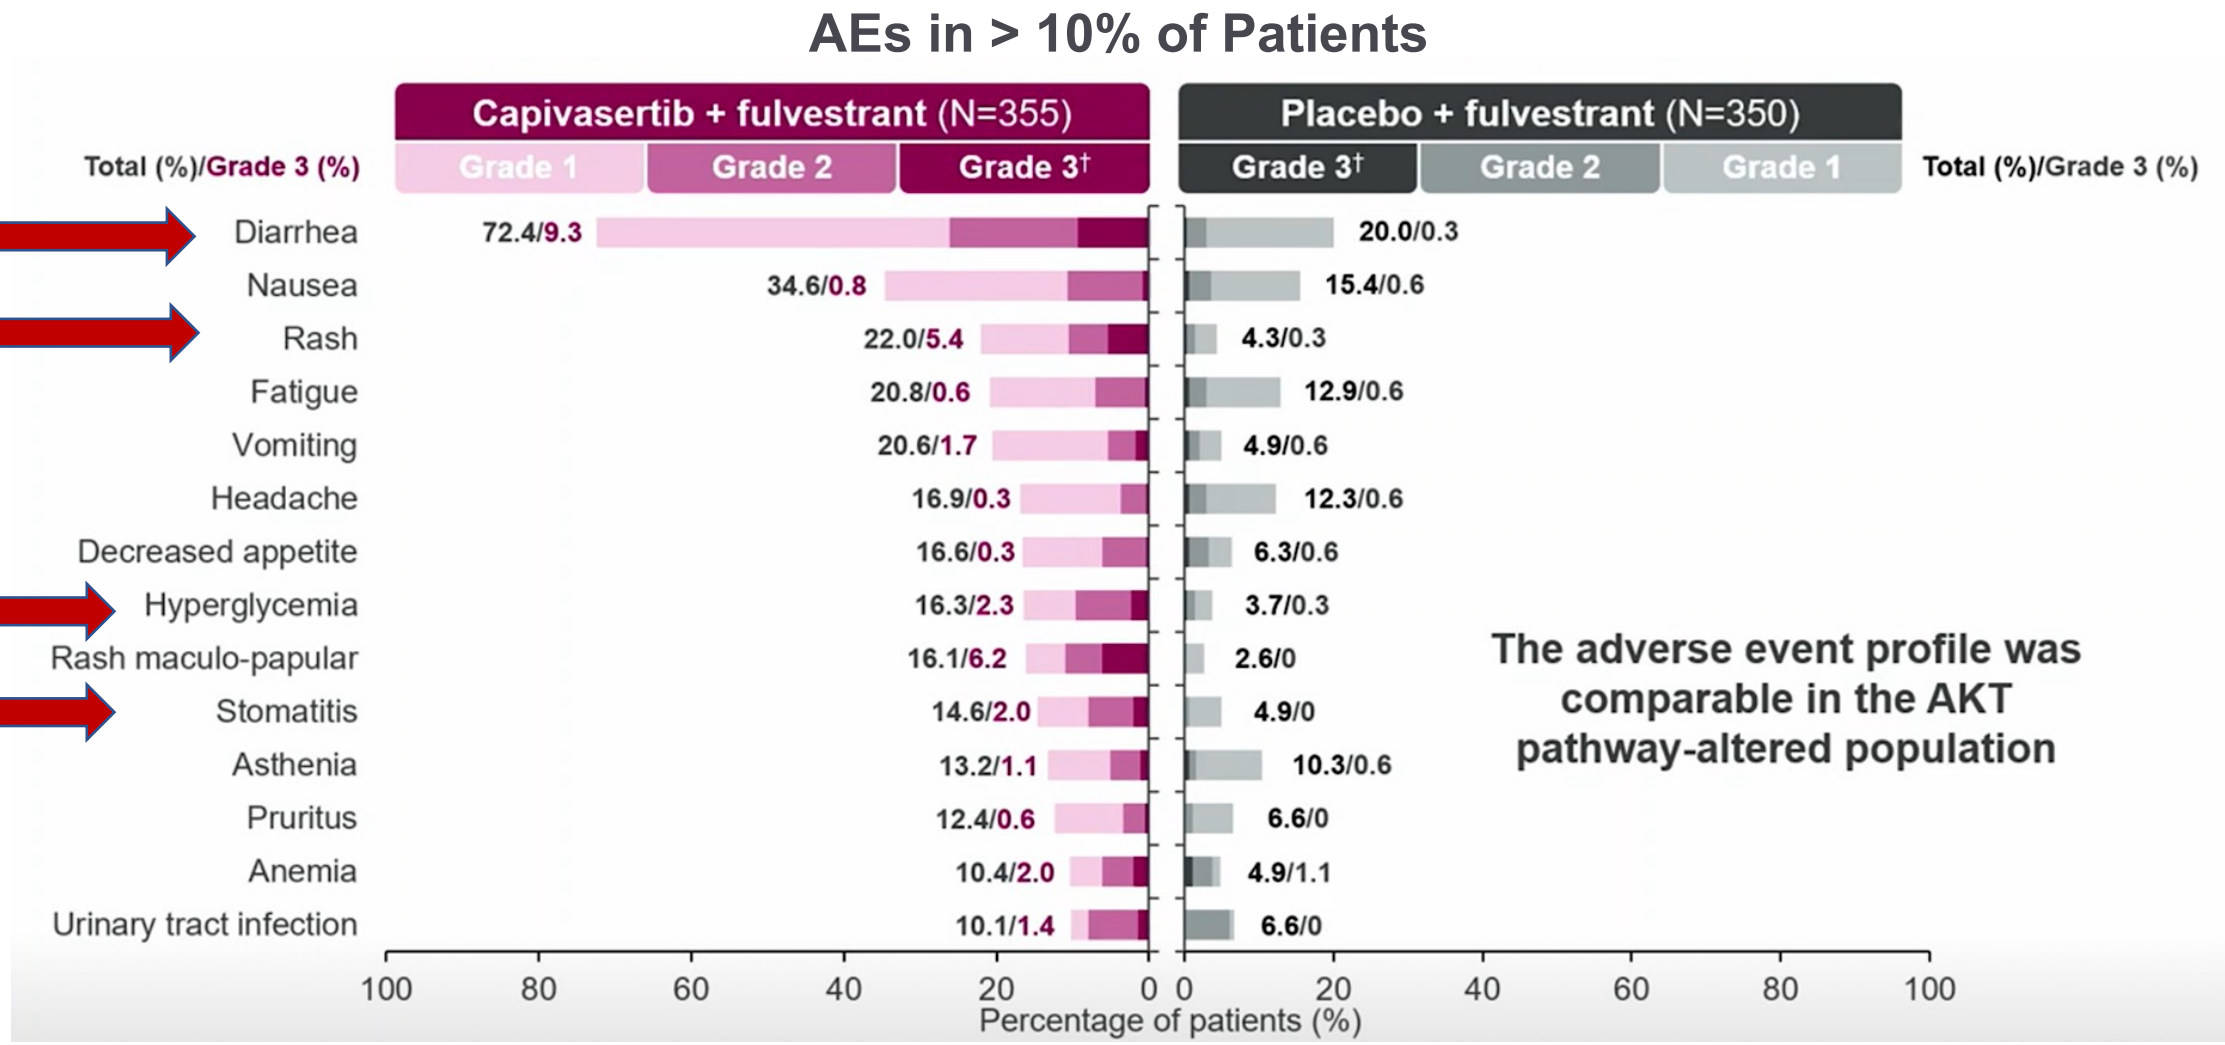
US FDA approval is for PI3K/AKT1/PTEN pathway altered group FoundationOne®CDx: companion diagnostic assay

PFS in patients with AKT pathway non-altered tumors, excluding unknown NGS result (exploratory analysis)



Turner NC et al. N Engl J Med. 2023;388(22):2058-2070

CAPItello-291: Capivasertib, AKT inhibitor
Adverse Events



35% dose interruption; 20% dose reduction and Discontinuation rate 13%; 9% due to capivasertib

Turner SC, et al. SABCS 2022; Turner NC et al. N Engl J Med. 2023;388(22):2058-2070.

Toxicity Summary: Everolimus, Capivasertib, Alpelisib

	Alpelisib (PI3Ki)		Capivasertib (AKTi)		Everolimus (mTORi)

Agenda

Module 1: Optimal Integration of CDK4/6 Inhibitors into the Management of ER-Positive Metastatic Breast Cancer (mBC) — Dr Kaklamani

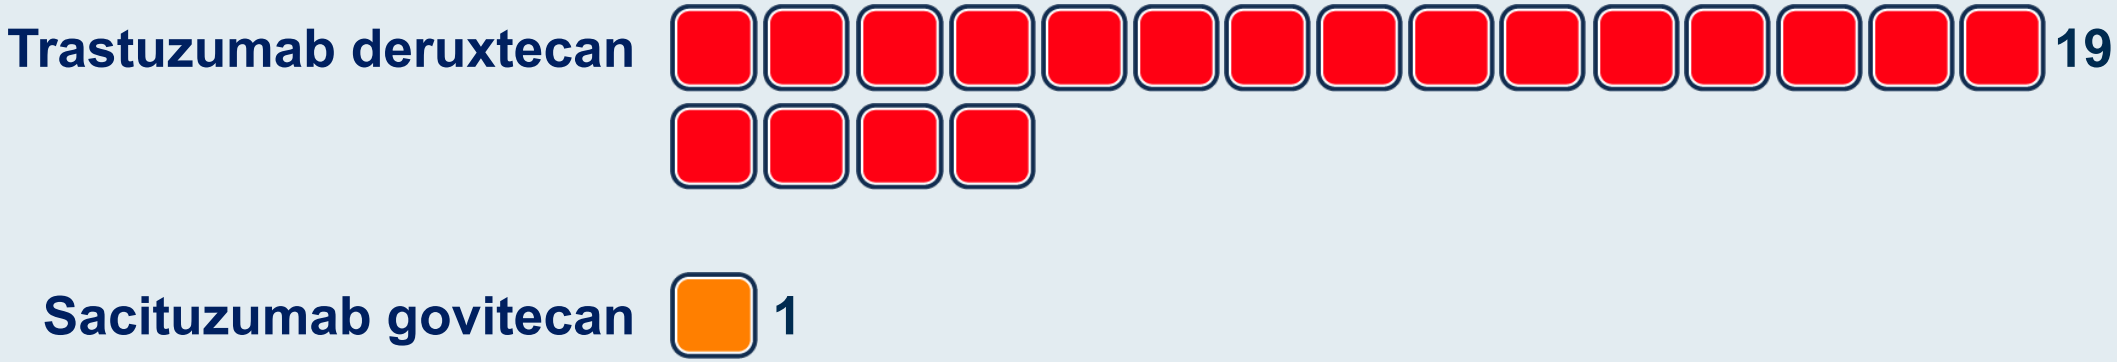
Module 2: Novel Strategies to Overcome Resistance to Endocrine Therapy — Dr Jhaveri

Module 3: Current Role of Antibody-Drug Conjugates in the Management of ER-Positive mBC — Dr Rugo

Module 4: Current and Future Role of Selective Estrogen Receptor Degraders (SERDs) in the Management of ER-Positive mBC — Prof Bidard

Module 5: Novel Therapies Under Investigation for Patients with ER-Positive mBC — Dr Hamilton

A 65-year-old woman with ER-positive, HER2-low (IHC = 2) metastatic breast cancer has exhausted all available endocrine therapy options and experienced disease progression on capecitabine. Regulatory and reimbursement issues aside, would you most likely use trastuzumab deruxtecan or sacituzumab govitecan as the next line of treatment?



Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

How do you generally sequence the following agents for a patient with HER2-low metastatic breast cancer who is eligible to receive both?

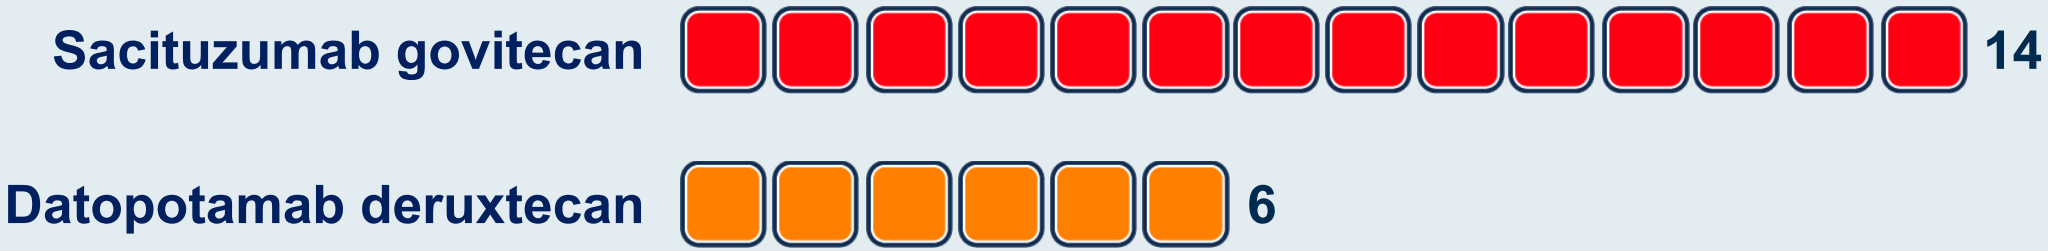
ER-Positive

ER-Negative

Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

A 65-year-old woman with ER-positive, HER2-negative (IHC = 0) metastatic breast cancer has exhausted all available endocrine therapy options and experienced disease progression on capecitabine. Regulatory and reimbursement issues aside, would you most likely use sacituzumab govitecan or datopotamab deruxtecan as the next line of treatment?



Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

Based on your personal clinical experience and knowledge of available data, for each of the following agents please estimate the chance that a patient will experience toxicity during treatment that will require withholding administration. What is the primary toxicity patients experience that leads to withholding the drug?

	Chance of withholding*	Primary toxicity
Trastuzumab deruxtecan	15% (10% - 50%)	Pneumonitis/ILD
Sacituzumab govitecan	20% (5% - 50%)	Neutropenia, diarrhea

ILD = interstitial lung disease
*** Median (Range)**

Survey of 20 US-based clinical investigators November 2023

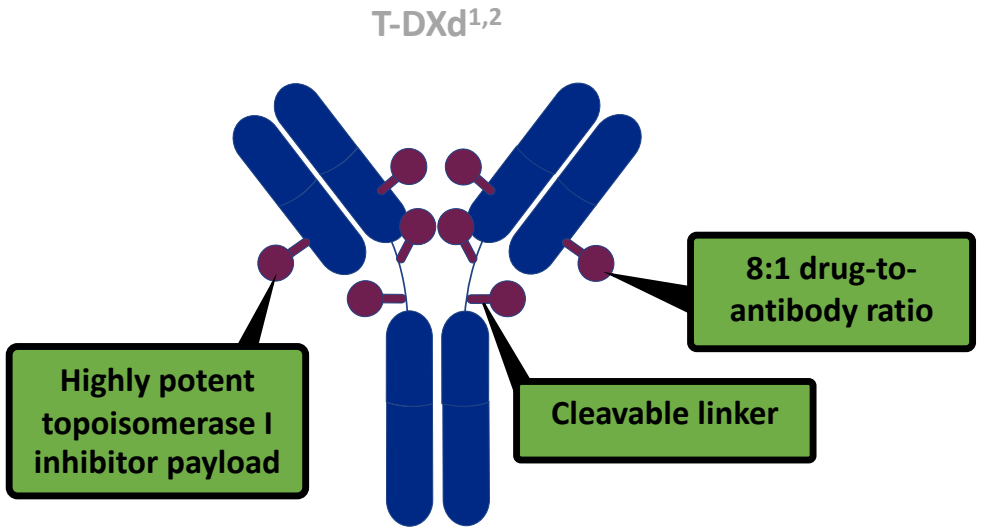
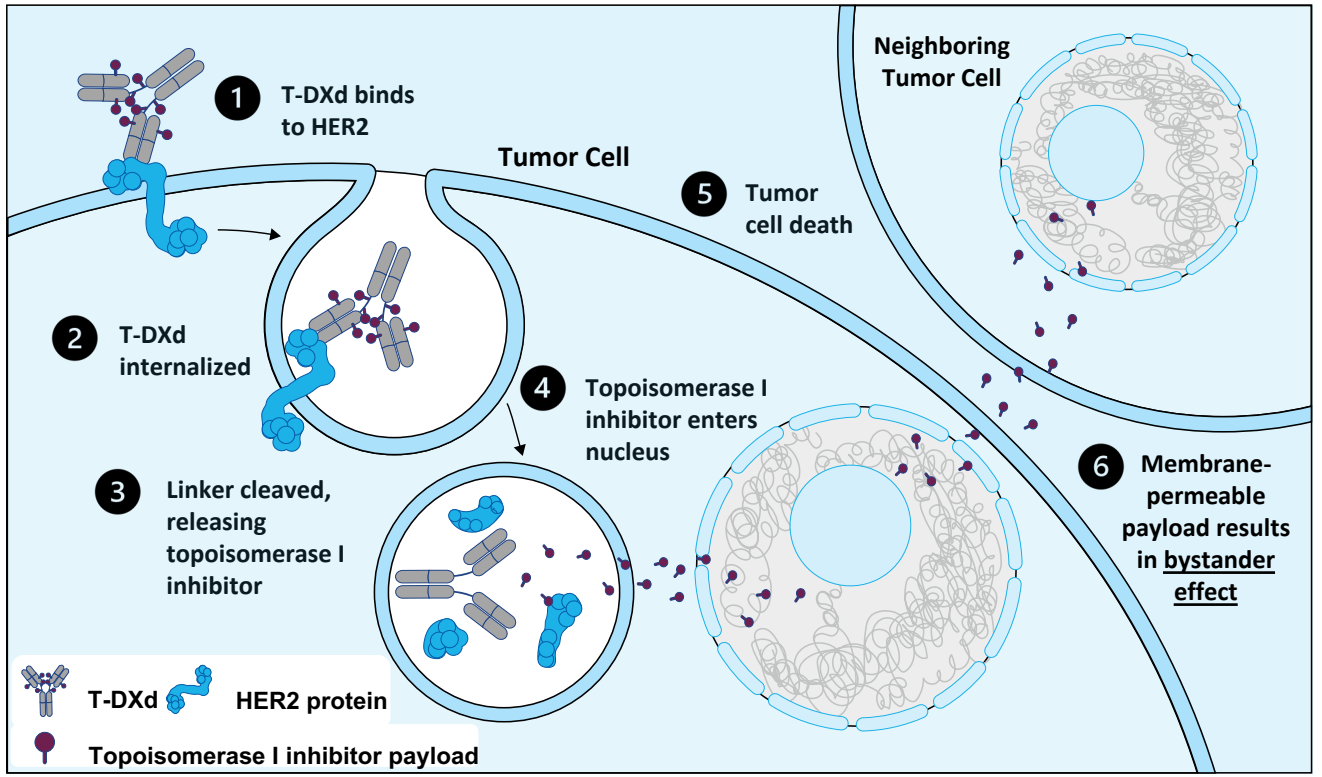
Current Clinical Evidence: Antibody Drug Conjugates

- **An exciting and effective drug delivery system for the treatment of multiple subtypes of mBC – it's still chemotherapy!**
- **Remarkable efficacy and established role in HER2+ disease**
- **Established role in TNBC**
  - Sacituzumab govitecan is a new standard of care for mTNBC
- **Established role in HER2 low and HR+ disease**
  - T-DXd is a new standard of care for HER2 'low' disease
  - Sacituzumab govitecan is an effective treatment option for pre-treated HR+ disease
- **Ongoing trials in earlier lines, early-stage disease, and new ADCs in phase III trials**
- **Many questions remain!**
  - Defining HER2 low
  - Sequencing of ADCs
  - Mechanisms of resistance
- **Toxicity management is critical**

T-DXd MOA, Bystander Effect, and Rationale for Targeting HER2-low mBC



Internalization of T-DXd leads to release of the DXd payload and subsequent cell death in the target tumor cell and neighboring tumor cells through the bystander effect[1,2]



Adapted with permission from Modi S, et al. *J Clin Oncol* 2020;38:1887-96. CC BY ND 4.0.

- **Results from a phase 1b study have reported efficacy of T-DXd in heavily pretreated patients (N = 54) with HER2-low mBC, with a mPFS of 11.1 months and an ORR of 37.0%[3]**

HER2, human epidermal growth factor receptor 2; MOA, mechanism of action; mBC, metastatic breast cancer; mPFS, median progression-free survival; ORR, objective response rate; T-DXd, trastuzumab deruxtecan.

DESTINY-Breast04: Updated Survival Results of T-DXd in HER2-low Metastatic Breast Cancer

An open-label, multicenter study (NCT03734029)[1-3]

Patients[a]
- HER2-low (IHC 1+ or IHC 2+/ISH−), unresectable, and/or mBC treated with 1-2 prior lines of chemotherapy in the metastatic setting
- HR+ disease considered endocrine refractory

Stratification factors
- Centrally assessed HER2 status[b] (IHC 1+ vs IHC 2+/ISH−)
- 1 vs 2 prior lines of chemotherapy
- HR+ (with vs without prior treatment with CDK4/6i) vs HR−

R 2:1

T-DXd
5.4 mg/kg Q3W
(n = 373)

N=557

TPC
Capecitabine, eribulin, gemcitabine, paclitaxel, nab-paclitaxel[c]
(n = 184)

Primary endpoint
- PFS by BICR (HR+)

Key secondary endpoints[d]
- PFS by BICR (all patients)
- **OS (HR+ and all patients)**

Secondary endpoints[d]
- **PFS by investigator**
- ORR by BICR and investigator
- DOR by BICR
- **Safety**
- Patient-reported outcomes (HR+)[e]

Chemotherapy, n (%)	
Eribulin	94 (51.1)
Capecitabine	37 (20.1)
Nab-paclitaxel	19 (10.3)
Gemcitabine	19 (10.3)
Paclitaxel	15 (8.2)

At the updated data cutoff (March 1, 2023), median follow-up was 32.0 months (95% CI, 31.0-32.8 months)

- At the primary analysis (data cutoff, January 11, 2022), median follow-up was 18.4 months
- The primary analysis of PFS was by BICR; this is comparing investigator assessment
- Patient population: Median one line of chemotherapy for mBC, 65-70% prior CDKi, 70% liver mets

Modi et al, NEJM 2022; ESMO 2023

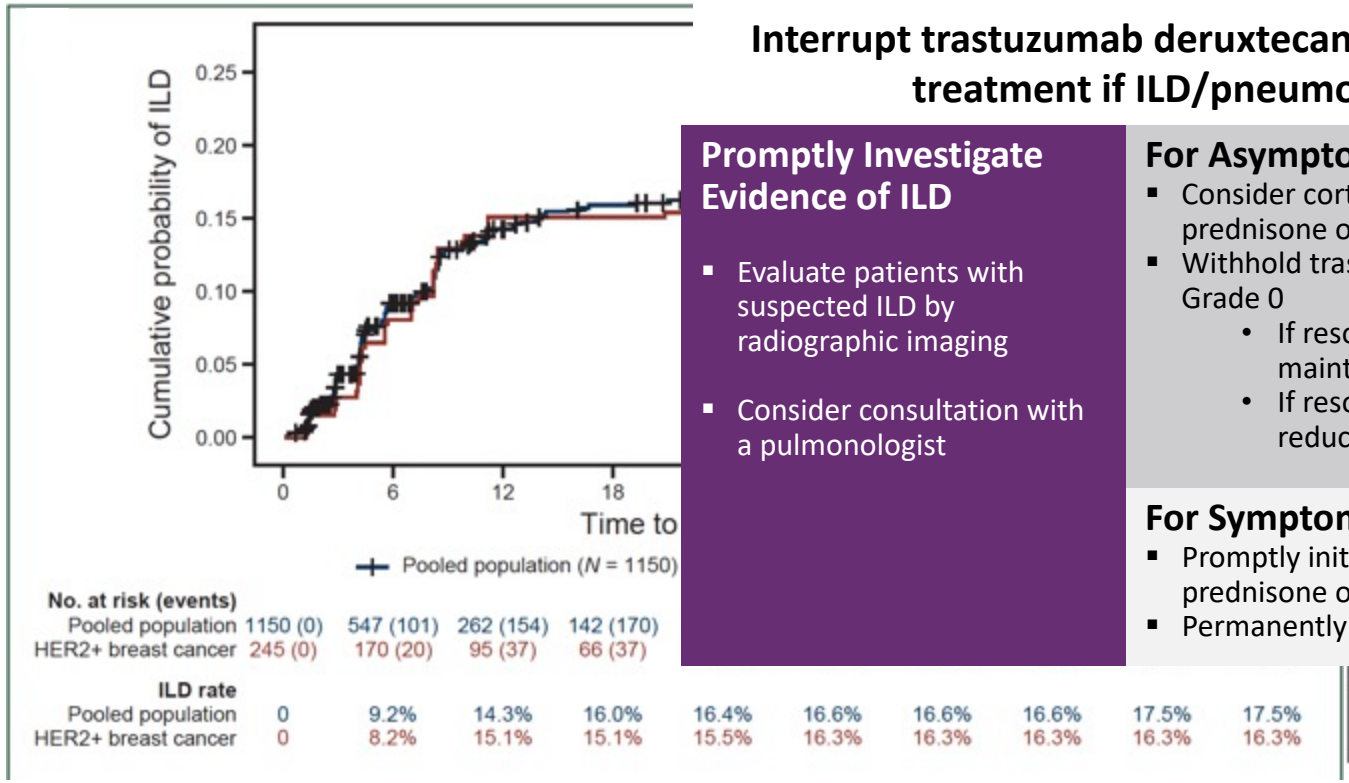
Pooled Analysis of ILD/Pneumonitis in 9 Trastuzumab deruxtecan Monotherapy Studies



Interrupt trastuzumab deruxtecan and initiate corticosteroid treatment if ILD/pneumonitis is suspected

Promptly Investigate Evidence of ILD

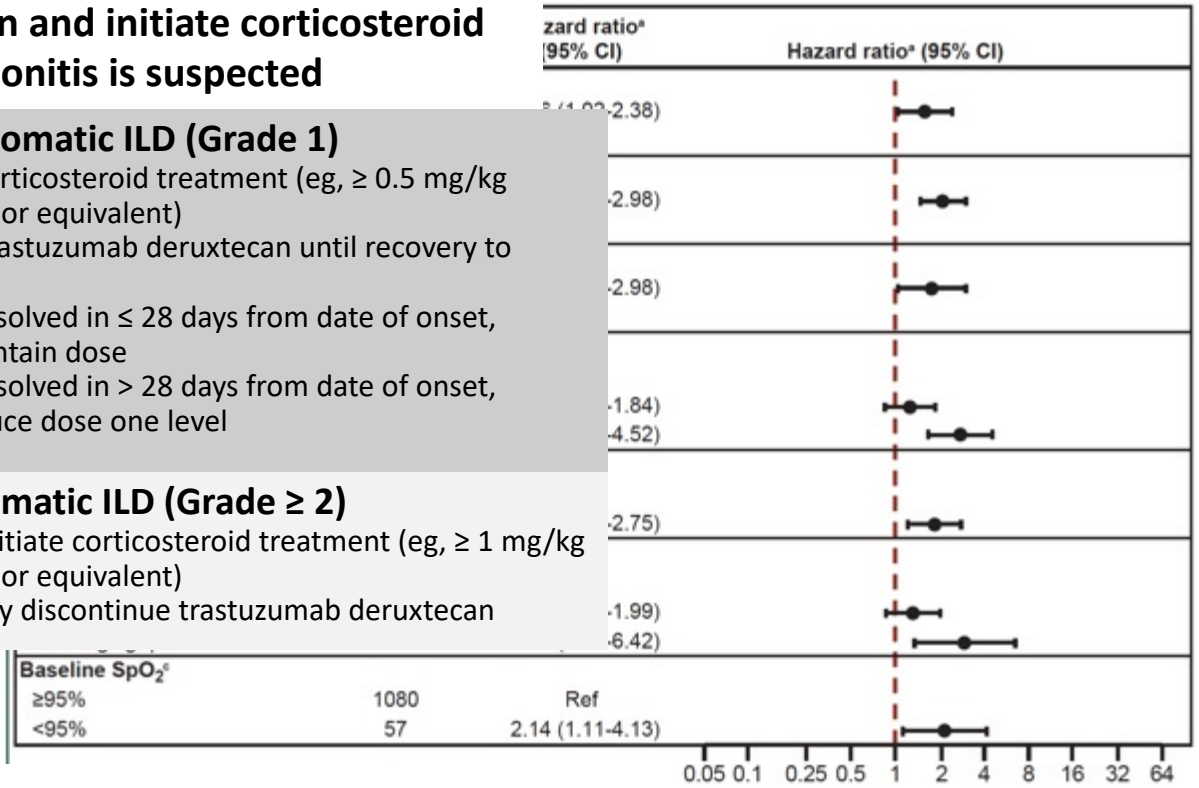
- Evaluate patients with suspected ILD by radiographic imaging
- Consider consultation with a pulmonologist

For Asymptomatic ILD (Grade 1)

- Consider corticosteroid treatment (eg, ≥ 0.5 mg/kg prednisone or equivalent)
- Withhold trastuzumab deruxtecan until recovery to Grade 0
  - If resolved in ≤ 28 days from date of onset, maintain dose
  - If resolved in > 28 days from date of onset, reduce dose one level

For Symptomatic ILD (Grade ≥ 2)

- Promptly initiate corticosteroid treatment (eg, ≥ 1 mg/kg prednisone or equivalent)
- Permanently discontinue trastuzumab deruxtecan



- 1150 pts (44.3% breast cancer) with a median treatment duration 5.8 mo (0.7-56.3)
- Overall incidence: 15.4% (grade 5: 2.2%); grade 1-2: 77.4%
- 87% had their first event within 12 months of their first dose

PFS was longer in cohort 1 (adj HR: 0.53, 95% CI 0.34–0.84, *P* = 0.007) and shorter in cohort 3 (adj HR: 1.96 95% CI 1.21–3.15, *P* = 0.006) comp to cohort 2.

Mosele et al, Nature Med 2023; 29:2110-2120

Testing Trastuzumab Deruxtecan in HER2 'Ultralow' DESTINY-Breast06

Key differences with DB-04:

- Includes IHC0 (ultralow, n=150)
- Larger (n=850)
- Restricted to HR+ disease
- Chemo-naïve patients

Status: Completed accrual

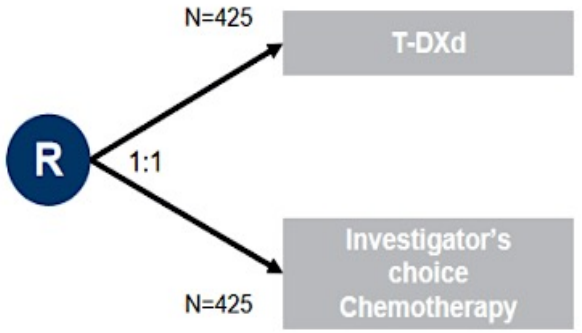
POPULATION

- Advanced/metastatic breast cancer after progression on 2 prior ETs
- HR+
- HER2 IHC 0+ or 1+ or 2+ (determined based on central IHC assessment of archival tissue collected at time of diagnosis of first metastatic disease or later)

Stratification factors:

- Prior CDK4/6 inhibitor
- HER2 IHC 2+ v. 1+ v. 0+
- Prior taxane in non-metastatic setting

TREATMENT



- Chemotherapy options: capecitabine, paclitaxel, nAb-paclitaxel
- Treatment continues until progressive disease or toxicity
- HER2 IHC 0+ defined by any IHC staining up to 10% of tumor cells
- Futility analysis in HER2 IHC 0+ cohort will be done

ENDPOINTS

Primary:

- PFS (BICR) in HER2 IHC 1+/2+ population

Key Secondary:

- OS in HER2 IHC 1+/2+ population
- PFS in ITT population
- OS in ITT population

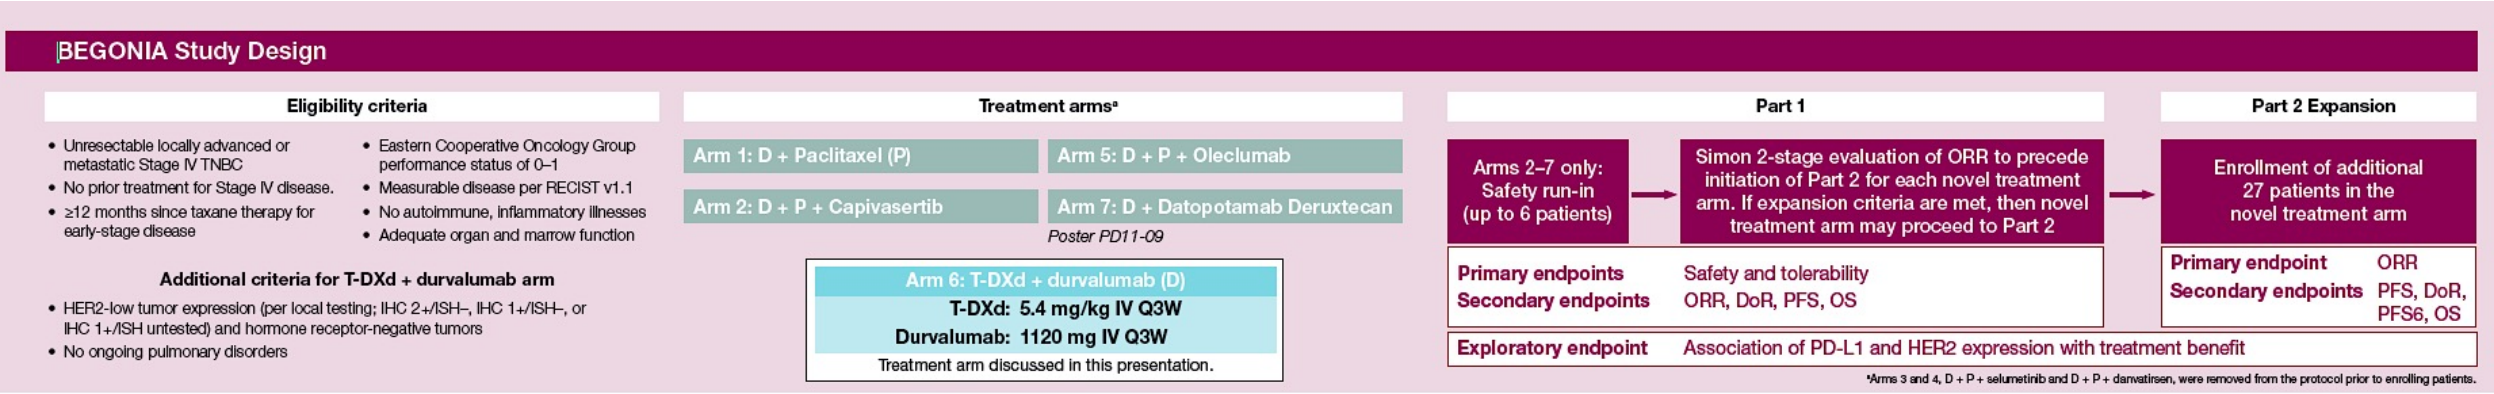
Secondary:

- PFS (investigator assessed) in HER2 IHC 1+/2+
- ORR and DOR of HER2 IHC 1+/2+ and ITT populations
- Safety and tolerability
- Symptoms, functioning and HRQoL

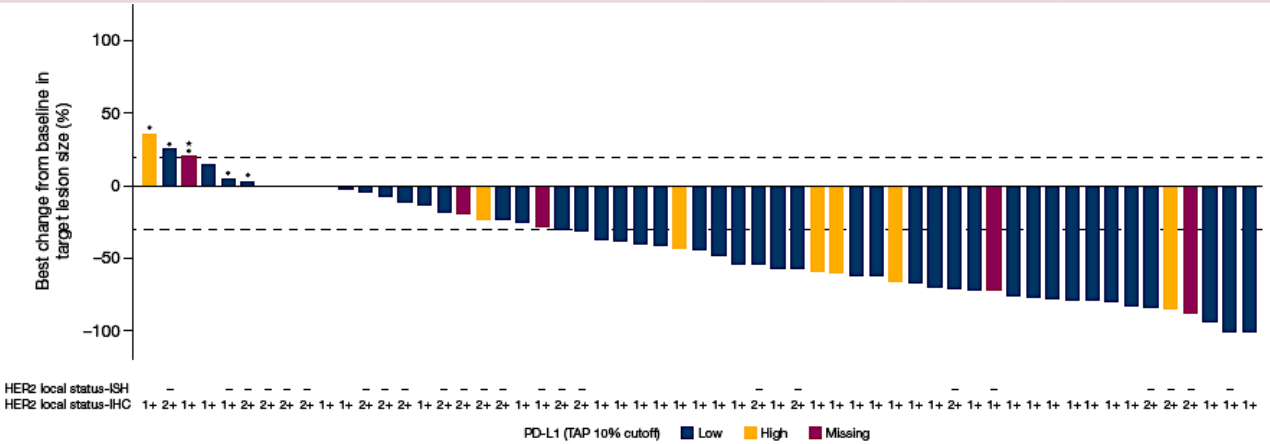
Exploratory:

- PRO
- Pharmacodynamic biomarkers

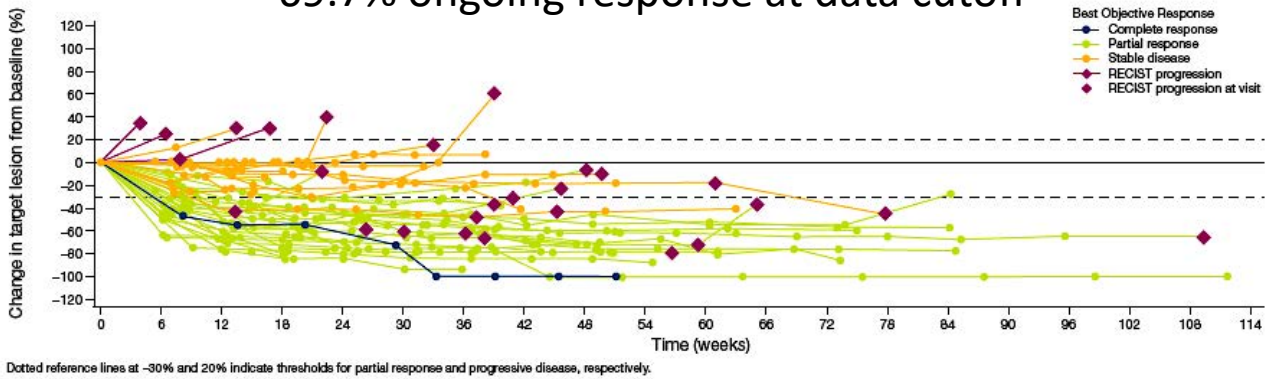
T-DXd + Durvalumab: The BEGONIA Trial



- First-line basket trial for HER2-low mTNBC
  - Arm 6 (n=58)
    - PD-L1 testing using SP263
    - ORR 56.9% (n=33)
    - PFS 12.6 mo (8.3-NC)
  - Safety
    - **8 cases of adjudicated ILD, 2 more pending review**
      - Grade 1 (3), grade 2 (2), grade 3 (1), grade 5 (1, Covid related)
      - 17% stopped rx due to AEs

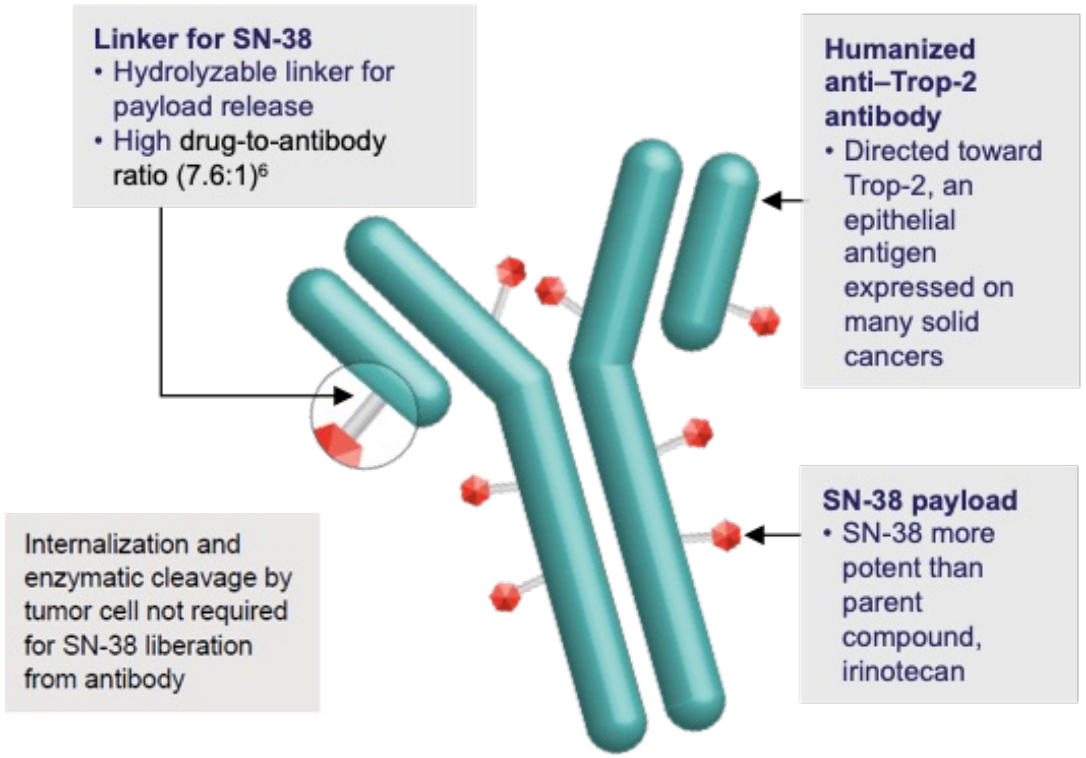


69.7% ongoing response at data cutoff



Schmid et al, SABCS 2022; PD11-08

Sacituzumab Govitecan (SG): First-in-Class Trop-2–Directed ADC



ASCENT Phase III Trial

	SG (n=235)	TPC (n=233)
No of events	167	150
Median PFS[1], mo (95% CI)	5.6 (4.3-6.3)	1.7 (1.5-2.6)
HR (95% CI), *P* value	0.39 (0.31-0.49), *P*<0.0001	

	SG (n=235)	TPC (n=233)
No of events	173	199
Median OS[1], mo (95% CI)	12.1 (10.7-14.0)	6.7 (5.8-7.7)
HR (95% CI), *P* value	0.48 (0.39-0.59), *P*<0.0001	
OS Rate (24 mo), % (95% CI)	22.4 (16.8-28.5)	5.2 (2.5-9.4)

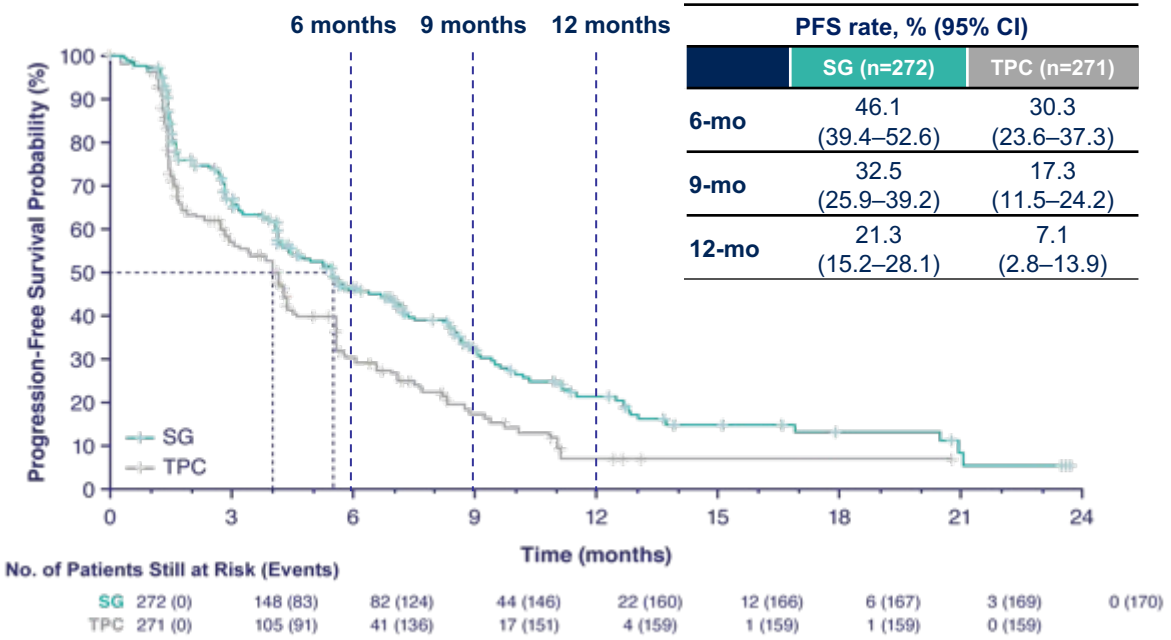
- Trop-2 is expressed in all subtypes of breast cancer and linked to poor prognosis
- **Key grade ≥3 TRAEs (SG vs TPC): neutropenia (51% vs 33%), diarrhea (10% vs <1%), leukopenia (10% vs 5%), anemia (8% vs 5%), FN (6% vs 2%)**
  - G-CSF: 49% in the SG arm vs 23% in the TPC arm
  - Dose reductions due to TRAEs were similar (22% SG vs 26% TPC)
  - No severe CV toxicity, no grade >2 neuropathy or grade >3 ILD with SG

Bardia et al. *NEJM*, 2021.

TROPiCS-02 for HR+/HER2- Disease: PFS & OS in the ITT Population

PFS[1]

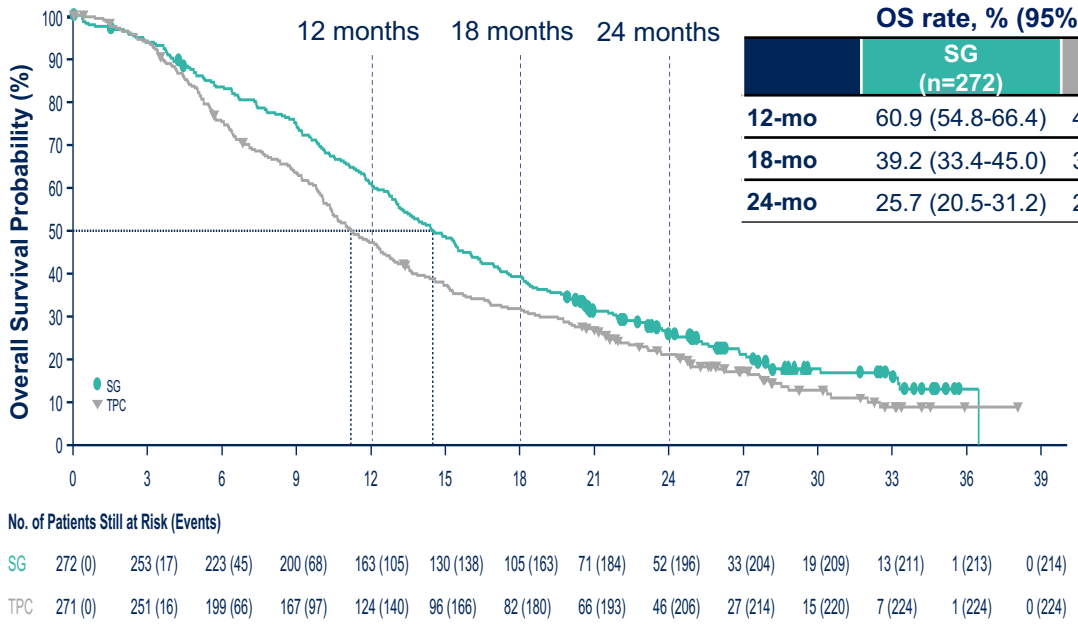
BICR analysis	SG (n=272)	TPC (n=271)
Median PFS, mo (95% CI)	5.5 (4.2–7.0)	4.0 (3.1–4.4)
Stratified HR (95% CI)	**0.66** (0.53–0.83)	
Stratified Log Rank *P* value	*P*=0.0003	



PFS rate, % (95% CI)	SG (n=272)	TPC (n=271)
6-mo	46.1 (39.4–52.6)	30.3 (23.6–37.3)
9-mo	32.5 (25.9–39.2)	17.3 (11.5–24.2)
12-mo	21.3 (15.2–28.1)	7.1 (2.8–13.9)

OS[2,3]

	SG (n=272)	TPC (n=271)
Median OS, mo (95% CI)	14.5 (13.0–16.0)	11.2 (10.2–12.6)
Stratified HR (95% CI)	**0.79** (0.65–0.95)	
Nominal *P* value	*P*=0.0133	



OS rate, % (95% CI)	SG (n=272)	TPC (n=271)
12-mo	60.9 (54.8-66.4)	47.1 (41.0-53.0)
18-mo	39.2 (33.4-45.0)	31.7 (26.2-37.4)
24-mo	25.7 (20.5-31.2)	21.1 (16.3-26.3)

SG demonstrated a statistically significant improvement in PFS and OS vs TPC

Median follow-up was 10.2 months.

BICR, blinded independent central review; ITT, intent-to-treat; OS, overall survival; PFS, progression-free survival; SG, sacituzumab govitecan; TPC, treatment of physician's choice.

ASCENT-03 (NCT05382299): PD-L1 negative
N=540

First-line therapy
- PD-L1 neg TNBC
- TNBC Rxd with IO in early stage

→ Sacituzumab govitecan

→ TPC: paclitaxel, nab-paclitaxel, gem/carbo

ASCENT-04 (NCT05382286): PD-L1 positive
N=570

1L mTNBC PD-L1+
- Previously untreated, inoperable, locally advanced, OR metastatic TNBC
- PD-L1+ (CPS ≥10, IHC 22C3 assay)
- PD-L1 and TNBC status centrally confirmed
- Prior anti-PD-(L)1 allowed in the curative setting
- ≥6 months since treatment in curative setting

1:1

N=570
(≤25% *de novo*)

→ SG + pembrolizumab
(SG: 10 mg/kg IV on days 1 and 8 of 21-day cycles; Pembro: 200 mg IV on day 1 of 21-day cycles)

→ TPC chemotherapy + pembrolizumab
(Pembro dosed as above. TPC: gem 1000 mg/m² with carbo AUC 2 IV on days 1 and 8 of 21-day cycles OR paclitaxel 90 mg/m² IV on days 1, 8, and 15 of 28-day cycles OR nab-paclitaxel: 100 mg/m² IV on days 1, 8, and 15 of 28-day cycles)

SACI-IO TNBC and HR+: Sacituzumab govitecan +/− pembrolizumab in 1L PD-L1− mTNBC and HR+

Garrido-Castro/Tolaney

mTNBC
- No prior chemo
  No prior PD-1/L1
- PD-L1 <1% by SP-142
  ER ≤5%
  PR ≤5%
  HER2-
- Stable brain mets
- Exclude prior: PD-1/L1, SG, Irinotecan

mHR+/HER2-
- ≥ 1 Hormonal
- 0-1 Prior Chemo
- Exclude prior: PD-1/L1, SG, Irinotecan

N=110

1:1

N=110

→ Sacituzumab govitecan 10 mg/kg IV d1, 8 q21 days + pembrolizumab 200 mg/kg d1 q21 days

→ Sacituzumab govitecan 10 mg/kg d1,8 q21 days

Endpoints
Primary
- PFS

Secondary
- OS, ORR
- Duration and time to objective response, time to progression, CBR
- Safety and tolerability

80% power to detect PFS improvement from 5.5 months (Arm B) to 8.5 months (Arm A)

ASCENT-07:
First-line Chemotherapy in HR+

Key eligibility criteria:
- HR+/HER2* negative, locally advanced and unresectable, or metastatic breast cancer
- Eligible for first chemotherapy for advanced mBC
- Progressed after 1 or more ET for mBC, or relapsed within 12 months of completing adjuvant ET or while receiving adjuvant ET
- No prior treatment with a topoisomerase I inhibitor
- Measurable disease per RECIST v1.1
- Prior CDK 4/6i not required (no prior CDK 4/6i capped at 30%)

N = 654

2:1 randomization

→ Sacituzumab govitecan 10 mg/kg IV Days 1 and 8, every 21 days

→ Treatment of physician's choice (capecitabine, paclitaxel, nab-paclitaxel)

Stratification:
- Duration of prior CDK 4/6i in metastatic setting (none/≤12 mos vs >12 mos)
- HER2 IHC (HER2 IHC 0 vs HER2 IHC-low ([IHC 1+; 2+/ISH-])
- Geographic region (US/CAN/EU vs. ROW)

Primary Endpoint
- PFS by BICR

Key Secondary Endpoints
- OS
- ORR by BICR
- TTDD to Physical functioning

Secondary Endpoints
- PFS by investigator
- ORR by investigator
- DOR
- Safety

GBG: SASCIA Post-Neoadjuvant Trial
NCT04595565

N=1200
HER2-negative early breast cancer

- At least 16 weeks of taxane-based NACT
- No pCR:
  - TNBC
  - HR-positive and CPS-EG score ≥3 or 2 and ypN+

R 1:1

→ Sacituzumab govitecan (8 cycles d1, 8 q3w)

→ Treatment of physician´s choice*

Follow-up

Stratification factors:
- HR-positive vs HR-negative
- ypN+ vs ypN-0

Phase III Trial: OptimICE-RD/ASCENT-05
Residual disease in TNBC

Residual invasive TNBC disease in breast or positive node(s) after anthracycline, taxane, and checkpoint inhibitor-based neoadjuvant therapy
N = 1514

R 1:1

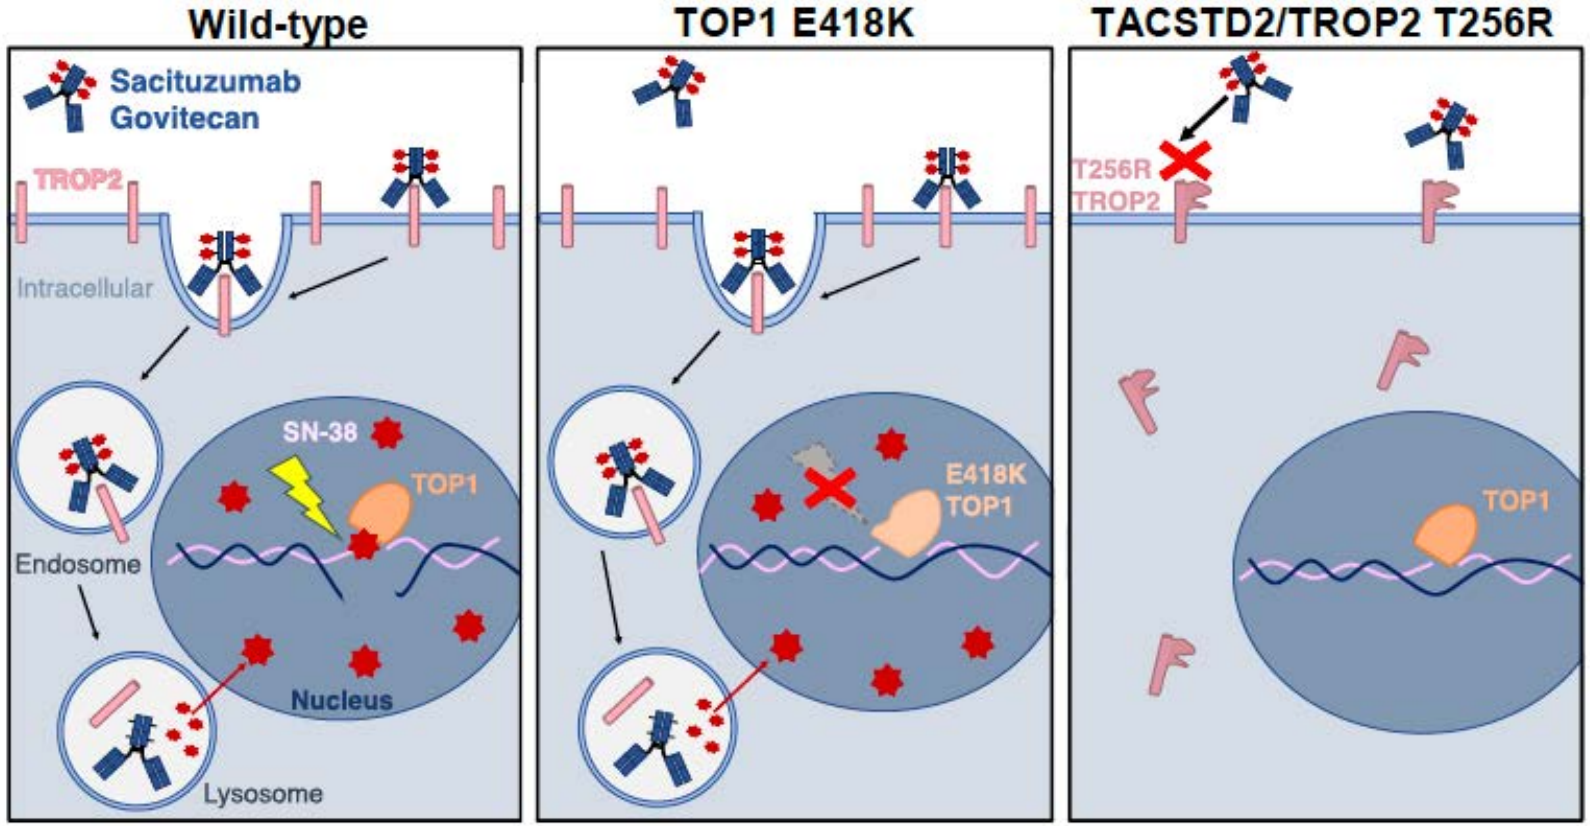
→ A: Sacituzumab Govitecan x 8 cycles + Pembrolizumab x 8 cycles

→ B: Pembrolizumab x 8 cycles (add-on capecitabine per physician's choice)

Follow-up

PI: Sara Tolaney; Alliance Foundation Trial

Mechanisms of Resistance to TROP2 ADC



- Analysis of tumor tissue from 3 patients pre- and post-Sacituzumab treatment
- Two acquired resistance mechanisms identified
  - Mutations in TOP1 leading to decreased binding of SN38 with topoisomerase I
  - Mutation in TROP2 leading to decreased binding of SG and decreased cell surface expression

Failed SN38/TOP1 Binding → Resistance to payload

Altered TROP2 Localization and Binding → Resistance to antibody target

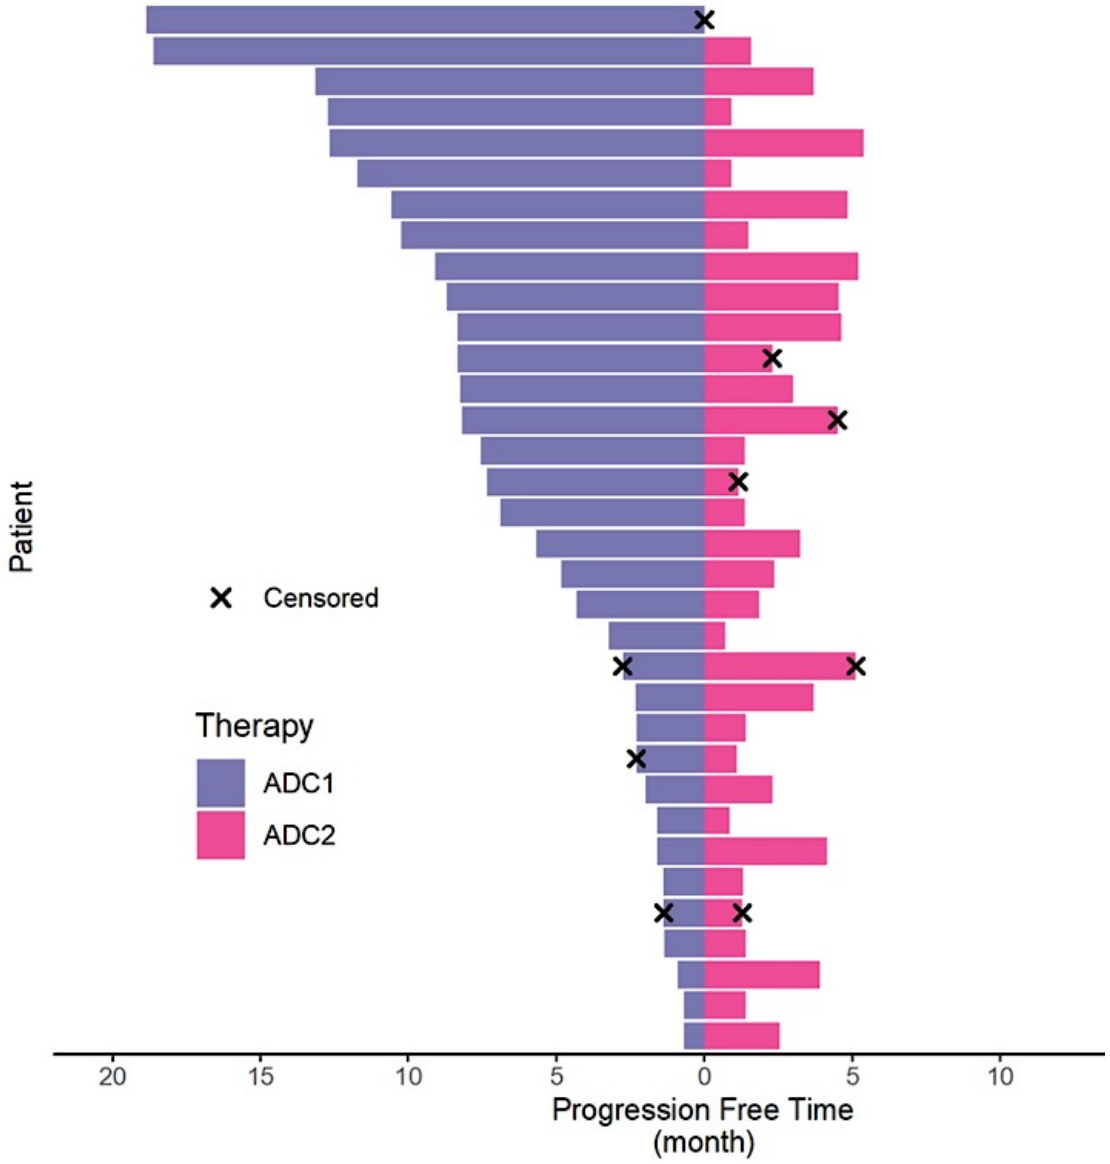
Coates et al. Cancer Discov 2021; courtesy of Elison

Single center study of sequential use of ADC after ADC for patients with MBC

Key Eligibility Criteria

- HER2– MBC (HR+/HER2– or TNBC)
- Treated with 2+ ADCs for MBC at a single institution

Patient Characteristics		n=35
Breast cancer subtype, n (%)	HR+/HER2–	15 (42.9)
	TNBC	20 (57.1)
	HER2-low	24 (68.6)
Median age at second ADC, years		56
Median prior lines of treatment, n	HR+/HER2–	7
	TNBC	3
Antibody target of ADC1, n (%)	HER2	8 (22.9)
	Trop-2	26 (74.3)
	Other	1 (2.9)
Antibody target of ADC2, n (%)	HER2	14 (40.0)
	Trop-2	19 (54.3)
	Other	2 (5.7)
Payload of ADC1	TOP-1 inhibitor	35 (100)
Payload of ADC2	TOP-1 inhibitor	31 (88.6)
	Microtubule inhibitor	2 (5.7)
	Other	2 (5.7)



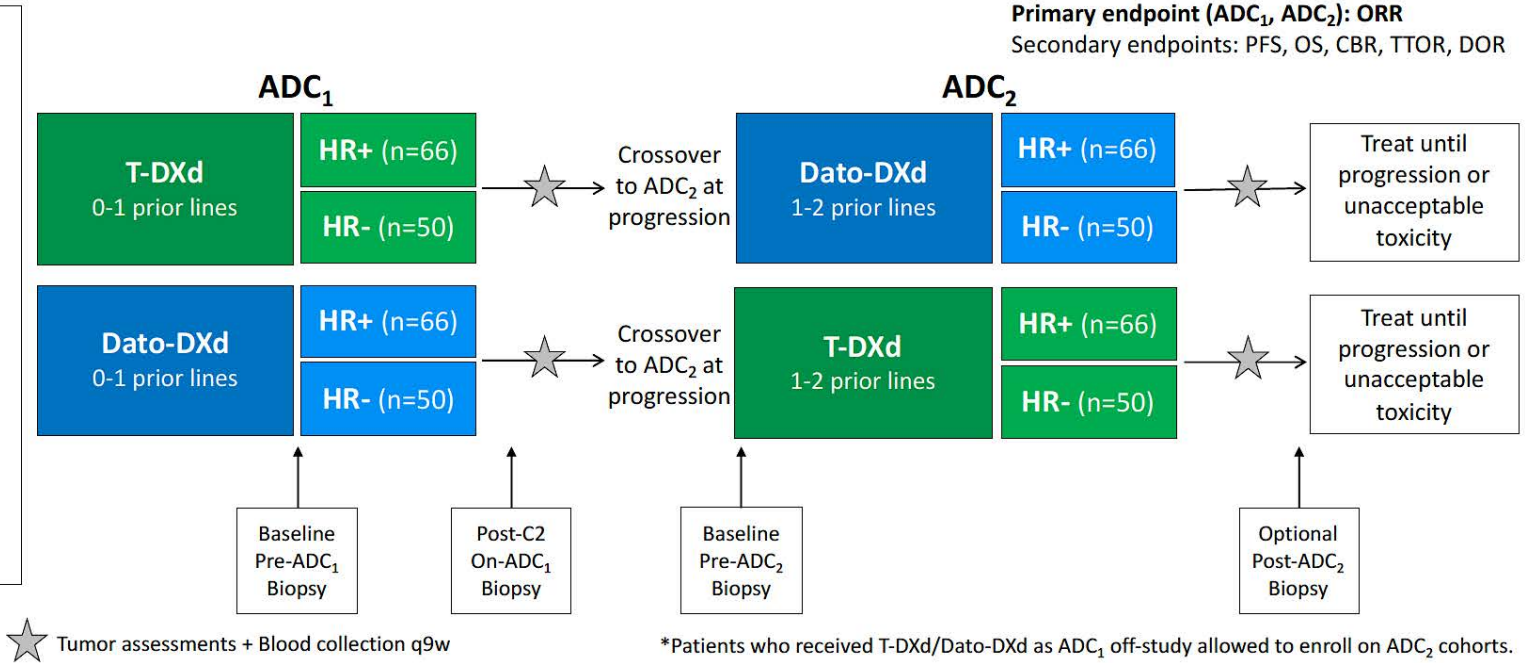
Abelman et. al. ASCO 2023

TBCRC 064: TReatment of ADC-Refractory Breast CancEr with Dato-DXd or T-DXd (TRADE-DXd).
PI: Ana Garrido-Castro

Eligibility:

- Confirmed unresectable locally advanced or metastatic disease
- History of HER2-low BC: IHC 1+ or 2+/ISH- (any sample: primary or met)
- Measurable disease
- Prior endocrine therapy and CDK4/6 inhibitor for HR+ MBC
- Prior topo-I inhibitor allowed only in neo-/adjuvant setting(s) and if ≥12m elapsed since last dose to metastatic recurrence

*Randomization 1:1 to T-DXd or Dato-DXd as ADC_1 for allocation purposes.



Registry Sequencing Study: Laura Huppert UCSF

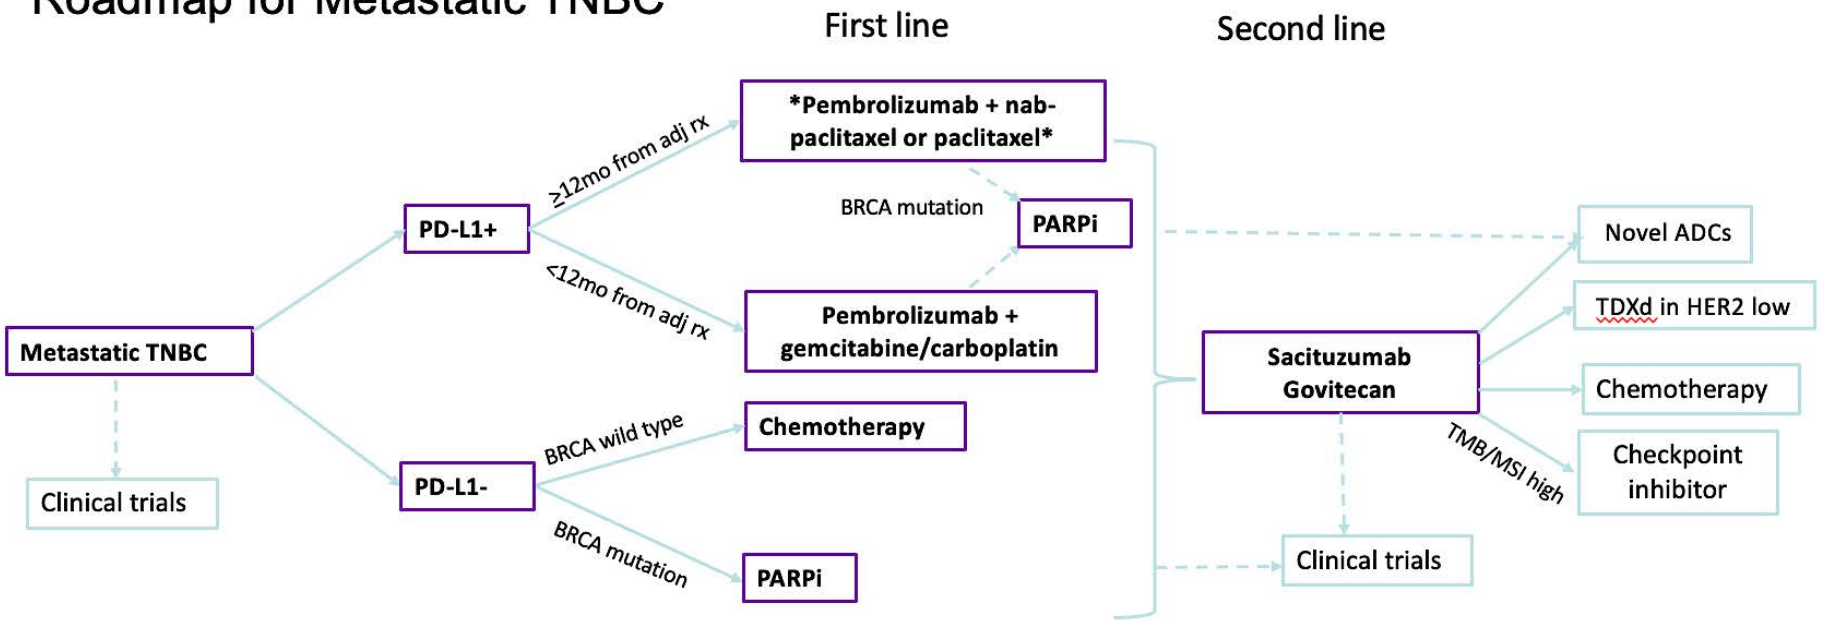
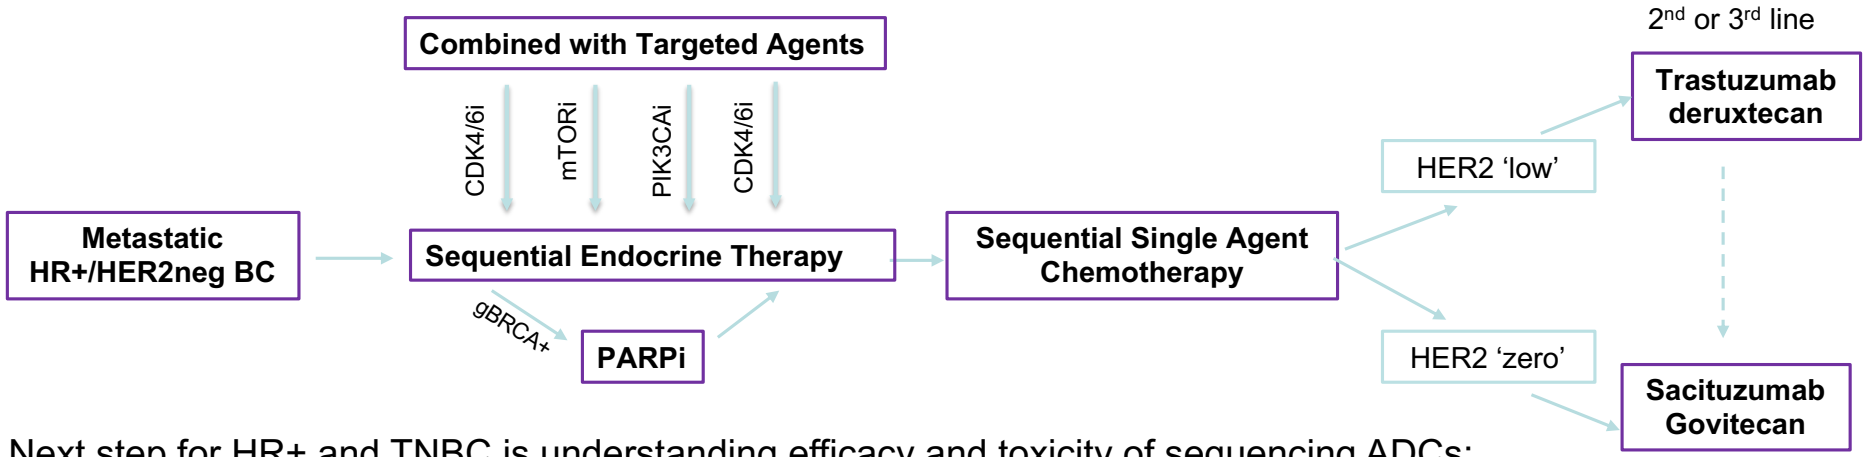
Roadmap for Metastatic TNBC



Roadmap for HR+/HER2- Metastatic Breast Cancer



Next step for HR+ and TNBC is understanding efficacy and toxicity of sequencing ADCs:

- TRADE-DXd (DFCI): DATO-Dxd and TDXd
- Sacituzumab sequenced registry trial (UCSF): SG and TDXd

Agenda

Module 1: Optimal Integration of CDK4/6 Inhibitors into the Management of ER-Positive Metastatic Breast Cancer (mBC) — Dr Kaklamani

Module 2: Novel Strategies to Overcome Resistance to Endocrine Therapy — Dr Jhaveri

Module 3: Current Role of Antibody-Drug Conjugates in the Management of ER-Positive mBC — Dr Rugo

Module 4: Current and Future Role of Selective Estrogen Receptor Degraders (SERDs) in the Management of ER-Positive mBC — Prof Bidard

Module 5: Novel Therapies Under Investigation for Patients with ER-Positive mBC — Dr Hamilton

RTP
RESEARCH
TO PRACTICE

Based on your personal clinical experience and knowledge of available data, for each of the following agents please estimate the chance that a patient will experience toxicity during treatment that will require withholding administration. What is the primary toxicity patients experience that leads to withholding the drug?

	Chance of withholding*	Primary toxicity
Elacestrant	5% (5% - 25%)	Nausea/GI toxicity
Camizestrant	7% (2% - 20%)	Photopsia, bradycardia
Imlunestrant	5% (2% - 20%)	Nausea/GI toxicity
Capivasertib	13% (5% - 40%)	Rash, GI toxicity

*** Median (Range)**

Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

If camizestrant were to become available, for which patients with ER-positive, HER2-negative metastatic breast cancer would you prioritize its use?

- Certainly for patients with metastatic ER+ breast cancer who had ESR1 mutations and had progressed on prior endocrine therapy but were still felt to be endocrine sensitive
- ESR1-mutant pts — toss up between camizestrant and elacestrant — they could be sequenced
- Patients with ESR1 mutation being detected while on 1st line AI+CDK4/6i
- The SERENA-2 patient population: post-menopausal patients with estrogen receptor (ER)-positive locally advanced or metastatic breast cancer, previously treated with endocrine therapy for advanced disease
- Depends on whether it is restricted to only ESR1, if it isn't I would use for all pts post AI + CDK4/6
- Patients with ESR1 mutant disease and indolent pace of progression

Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

If camizestrant were to become available, for which patients with ER-positive, HER2-negative metastatic breast cancer would you prioritize its use?

- ESR1mt tumors esp if had >12m PFS on ET + CDK4/6i although might be harder drug than Elacestrant
- Depends on if label extends beyond ESR1 mutation.Probably would be alternative to fulvestrant.
- We need more data to make this decision as we do not have phase III data yet. So we dont know if it will work for all or only those with ESR1 mutations.
- Not sure
- ESR1 mutant after fulvestrant

Survey of 20 US-based clinical investigators November 2023

Kaklamani et al, SABCS 2022, Abstract GS3-01.

EMERALD trial: Toxicity

- Most adverse events (AEs), including nausea, were grade 1 and 2, and no grade 4 treatment-related AEs (TRAEs) were reported.
- Only 3.4% of patients receiving elacestrant and 0.9% receiving SOC discontinued therapy due to any TRAE.
- No deaths assessed as treatment-related were reported in either arm.
- No hematologic safety signal was observed, and none of the patients in either treatment arm had sinus bradycardia.
- Dyslipidemia was infrequent, mostly grade 1, there were no discontinuations, and it was similar to SoC.

Nausea Summary	Elacestrant (n=237)	SOC (n=230)
Grade 3 nausea, n (%)	6 (2.5%)	2 (0.9%)
Dose-reduction rate due to nausea, n (%)	3 (1.3%)	Not applicable
Discontinuation rate due to nausea, n (%)	3 (1.3%)	0 (0%)
Antiemetic use	8%	10.3% (AI) 1.3% (Ful)

Bardia A et al. SABCS 2022 Abstract GS3-01.

EMERALD trial results led to FDA and EMA approvals in 2023

FDA label postmenopausal women or adult men with ER+, HER2-, **ESR1-mutated** advanced or metastatic breast cancer with disease progression following at least one line of endocrine therapy.

EMA label: Elacestrant monotherapy is indicated for the treatment of postmenopausal women, and men, with ER+, HER2-locally advanced or metastatic breast cancer with an **activating ESR1 mutation** who have disease progression following at least one line of endocrine therapy including a CDK4/6 inhibitor

Patients With Tumors Harboring *ESR1*mut

	Elacestrant	SOC
n	115	113
Events, n (%)	62 (53.9)	78 (69.0)
Median PFS, mo	3.78	1.87
P	.0005	
HR (95% CI)	0.546 (0.387-0.768)	

Elacestrant is associated with a 45% reduction in the risk of progression or death in patients harboring *ESR1*mut

Phase 2 trials with other ngSERD confirmed the exquisite sensitivity of ESR1mut+ mBC

	PFS HR ngSERD vs SoC in mBC pts (all comers)	PFS HR ngSERD vs SoC in $ESR1_{mut}$ not detected mBC pts	PFS HR ngSERD vs SoC in $ESR1_{mut}$+ mBC pts
AcelERA (giredestrant) [1]	0.81 95%CI [0.60, 1.10]	N/A	0.60 95%CI [0.35, 1.03]
SERENA-2 (camizestrant) [2]	0.58 * 90%CI [0.41, 0.81]	0.76 * 90%CI [0.50, 1.22]	0.33 * 90%CI [0.18, 0.58]

Grade 3-4 adverse events were observed in 17% and 12% of patients receiving ngSERD in the acelERA and SERENA-2 trials, respectively.

* 75mg cohort

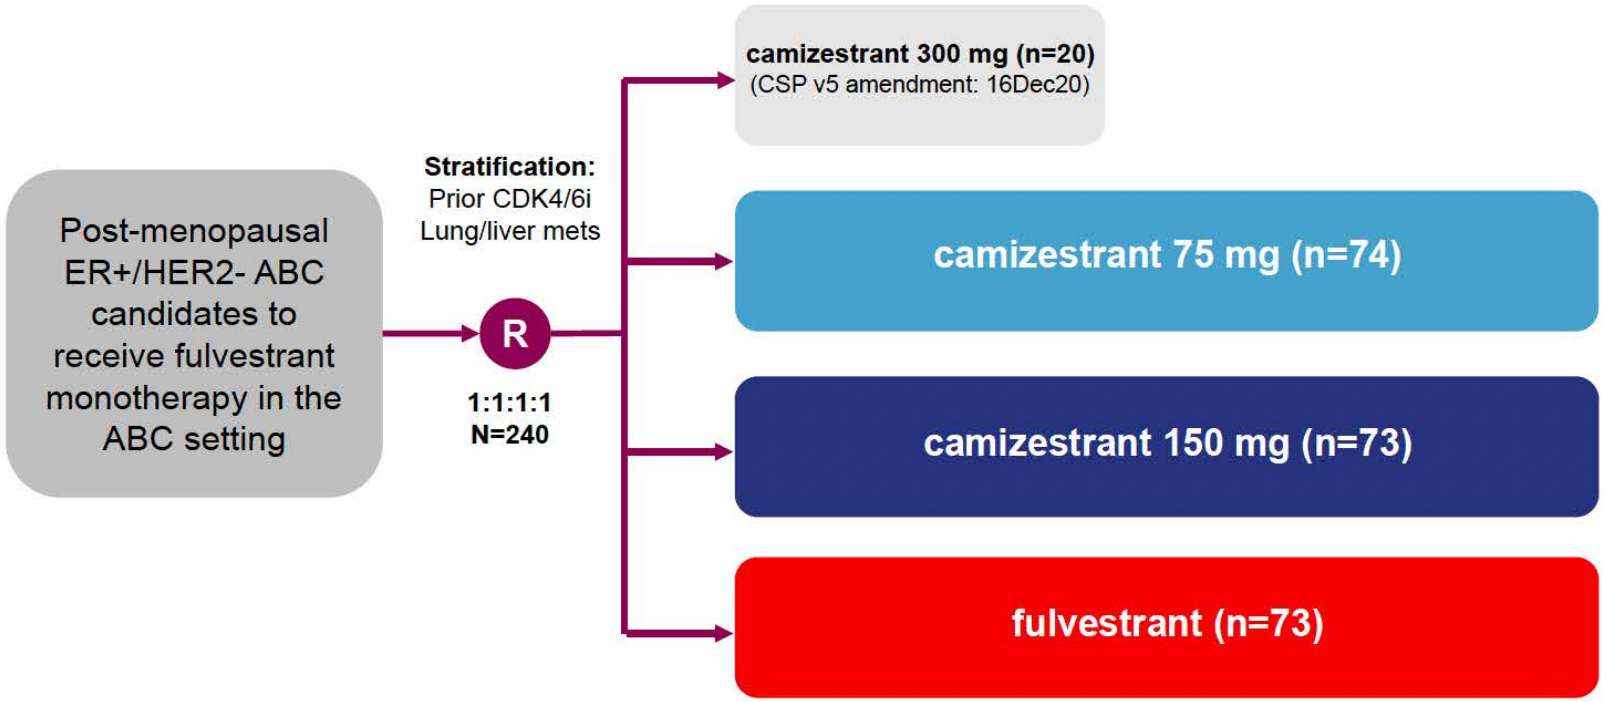
Oliveira M et al. SABCS 2022; Abstract GS3-02.

SERENA-2: Study Overview

Key inclusion/exclusion criteria:

- Recurrence or progression on at least one line of ET
- No prior fulvestrant or oral SERD in ABC
- No more than one line of ET in ABC setting
- No more than one line CT in ABC setting
- Measurable and non-measurable disease



- **Primary endpoint:** PFS (investigator assessment*)
- **Secondary endpoints:** CBR24, ORR, OS, safety
- **Translational endpoints:** serial ctDNA analysis including *ESR1*m, serial CTCs analysis

*disease progression assessed by the Investigator and defined using RECIST, version 1.1
ABC: advanced breast cancer; CBR24: clinical benefit rate at 24 weeks; CDK4/6i: CDK4/6 inhibitor; CT: chemotherapy; CTC: circulating tumor cells; ctDNA: circulating tumor DNA; ER: estrogen receptor; *ESR1*m: mutation in estrogen receptor 1 gene; ET: endocrine therapy; HER2: human epidermal growth factor; PFS: progression-free survival; R: randomization; RECIST: Response Evaluation Criteria for Solid Tumors; SERD: selective estrogen receptor degrader

Oliveira M et al. SABCS 2022; Abstract GS3-02.

SERENA-2: PFS by Investigator Assessment

	C 75 (n=74)	C 150 (n=73)	F (n=73)
Median duration of follow-up, months	16.6	16.6	17.4
Events [n (%)]	50 (67.6)	51(69.9)	58 (79.5)
Median PFS, months (90% CI)	7.2 (3.7-10.9)	7.7 (5.5-12.9)	3.7 (2.0-6.0)
Adjusted HR (90% CI)[a]	0.58 (0.41-0.81)	0.67 (0.48-0.92)	-
P value	0.0124*	0.0161*	-

C 75	74	50	33	27	21	14	7	2	1	0
C 150	73	50	37	32	25	12	6	2	0	
F	73	37	28	22	14	8	5	0		

In the overall population, camizestrant produces a statistically significant and clinically meaningful improvement in PFS for both 75 and 150 mg camizestrant doses over fulvestrant

Oliveira M et al. SABCS 2022; Abstract GS3-02.

RTP RESEARCH TO PRACTICE

SERENA-2: PFS in Patients by Detectable *ESR1*m

*ESR1*m detectable at baseline

	C 75 (n=22)	C 150 (n=26)	F 500 (n=35)
Events [n (%)]	15 (68.2)	22 (84.6)	31 (88.6)
Median PFS, months (90% CI)	6.3 (3.4-12.9)	9.2 (3.7-12.9)	2.2 (1.9-3.8)
Adjusted HR (90% CI)[a]	0.33 (0.18-0.58)	0.55 (0.33-0.89)	-

C 75	22	15	10	8	6	4	1	0	
C 150	26	18	15	14	9	3	2	0	
F	35	15	10	6	3	2	1	0	

*ESR1*m not detectable at baseline

	C 75 (n=51)	C 150 (n=46)	F 500 (n=37)
Events [n (%)]	34 (66.7)	28 (60.9)	26 (70.3)
Median PFS, months (90% CI)	7.2 (3.7-10.9)	5.8 (3.8-14.9)	7.2 (2.0-10.7)
Adjusted HR (90% CI)[a]	0.78 (0.50-1.22)	0.76 (0.48-1.20)	-

C 75	51	34	23	19	15	10	6	2	1	0
C 150	46	31	21	17	15	9	4	2	0	
F	37	21	18	16	11	6	4	1	0	

- In the sub-population of patients with detectable *ESR1*m at baseline, camizestrant at both doses produces a clinically meaningful improvement in PFS over fulvestrant

Oliveira M et al. SABCS 2022; Abstract GS3-02.

RTP RESEARCH TO PRACTICE

Agenda

Module 1: Optimal Integration of CDK4/6 Inhibitors into the Management of ER-Positive Metastatic Breast Cancer (mBC) — Dr Kaklamani

Module 2: Novel Strategies to Overcome Resistance to Endocrine Therapy — Dr Jhaveri

Module 3: Current Role of Antibody-Drug Conjugates in the Management of ER-Positive mBC — Dr Rugo

Module 4: Current and Future Role of Selective Estrogen Receptor Degraders (SERDs) in the Management of ER-Positive mBC — Prof Bidard

Module 5: Novel Therapies Under Investigation for Patients with ER-Positive mBC — Dr Hamilton

RTP RESEARCH TO PRACTICE

Based on your personal clinical experience and knowledge of available data, for each of the following agents please estimate the chance that a patient will experience toxicity during treatment that will require withholding administration. What is the primary toxicity patients experience that leads to withholding the drug?

	Chance of withholding*	Primary toxicity
Datopotamab deruxtecan	15% (5% - 30%)	Stomatitis, neutropenia
Patritumab deruxtecan	13% (2% - 30%)	Cytopenias

*** Median (Range)**

Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

If datopotamab deruxtecan were to become available, for which patients with ER-positive, HER2-negative metastatic breast cancer would you prioritize its use?

- Patients with HER2-0 MBC that have progressed already on chemotherapy
- Would likely pick between saci and dato based on side effect profile, efficacy, and dosing schedule
- After all endocrine options, HER2 IHC=0; or salvage setting after TDX-d in ER+/HER2-low.
- Vs other Trop2 ADC (SG): less pretreated setting, similar PFS delta, but SG has OS advantage. Vs other deruxtecan ADC (TDXd): not need HER2-low, less ILD. Not clearly advantageous over either SG or T-DXd.
- 2 or 3L line IHC 0; would discuss Sacituzumab vs Datopotamab- schedule and toxicity profile
- Patients with ER+ disease who had exhausted endocrine therapy

Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

If datopotamab deruxtecan were to become available, for which patients with ER-positive, HER2-negative metastatic breast cancer would you prioritize its use?

- After exhaustion of endocrine therapy options, after 1 or 2 lines of chemotherapy, after T-DXd if HER2-low, and after SG unless there is a good reason not to use SG first (contra-indication, tumor biomarker landscape, etc)
- Those that progress on sacituzumab govitecan
- Unclear that it is better than TDXd or SG
- Not sure
- 2L after capecitabine

Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

If patritumab deruxtecan were to become available, for which patients with ER-positive, HER2-negative metastatic breast cancer would you prioritize its use?

- At this point, HER3+ after T-DXd and SG, or after SG if high risk of ILD. How much HER3 expression is unknown (in lung cancer doesn't seem to matter).
- Highly pretreated patients with progression on several chemotherapies
- After exhaustion of endocrine therapy options, after 1 or 2 lines of chemotherapy, after T-DXd if HER2-low, and I would consider the tumor biomarker landscape (HER3 expression on most recent tissue ?)
- Likely post TDXd and TROP-2
- After all endocrine options, after TDX-d (if HER2 low); and after sacituzumab govitecan.

Survey of 20 US-based clinical investigators November 2023

RTP RESEARCH TO PRACTICE

If patritumab deruxtecan were to become available, for which patients with ER-positive, HER2-negative metastatic breast cancer would you prioritize its use?

- If HER2 low then post TDXD; if HER2 0 then post sacituzumab
- After exhaustion of all ET options and one line of chemotherapy and HER3 +
- Unclear that it is better than TDXd or SG
- Not sure I would use, would need to see phase III data to try to gauge relative benefits and would only use for those not a candidate of T-DXd.
- We just do not have enough data as yet. Likely later line given lack of current data except in the pre-treated setting.
- Probably 3rd line unless good data emerges for earlier lines

Survey of 20 US-based clinical investigators November 2023

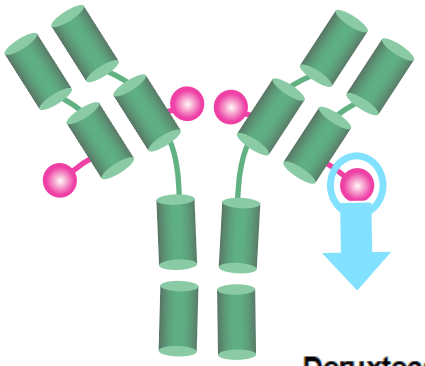
Datopotamab deruxtecan (Dato-DXd)

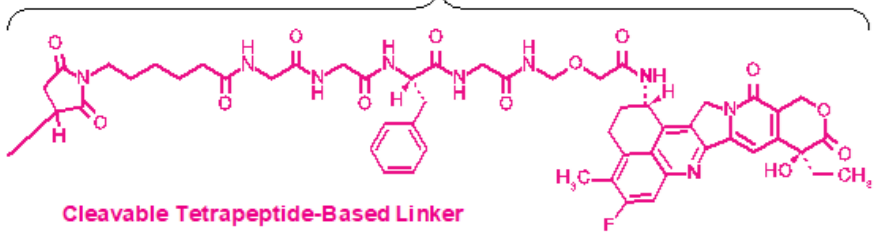
SARAH CANNON
Research Institute

Datopotamab deruxtecan (Dato-DXd): Trop-2 directed ADC

Dato-DXd: Humanised anti-TROP2 monoclonal antibody



Deruxtecan[6,a]



- High-potency TOPO1 payload
- Payload with short systemic half-life
- Optimised DAR ~4
- Tumour-selective cleavable linker
- Bystander anti-tumour effect

@ErikaHamilton9

TROPION-PanTumor01

- Unresectable or metastatic HR+/HER2− (IHC 0/1+ or IHC2+/ISH-) breast cancer
- Progressed on ≥1 endocrine therapy; previously treated with 1-3 prior lines of chemotherapy in the advanced setting
- Unselected for TROP2 expression[a]
- Age ≥18 years (US) or ≥20 years (Japan)
- ECOG PS 0-1
- Measurable disease per RECIST 1.1
- Stable, treated brain metastases allowed

→ **HR+/HER2− breast cancer**
6 mg/kg IV Q3W (n=41)

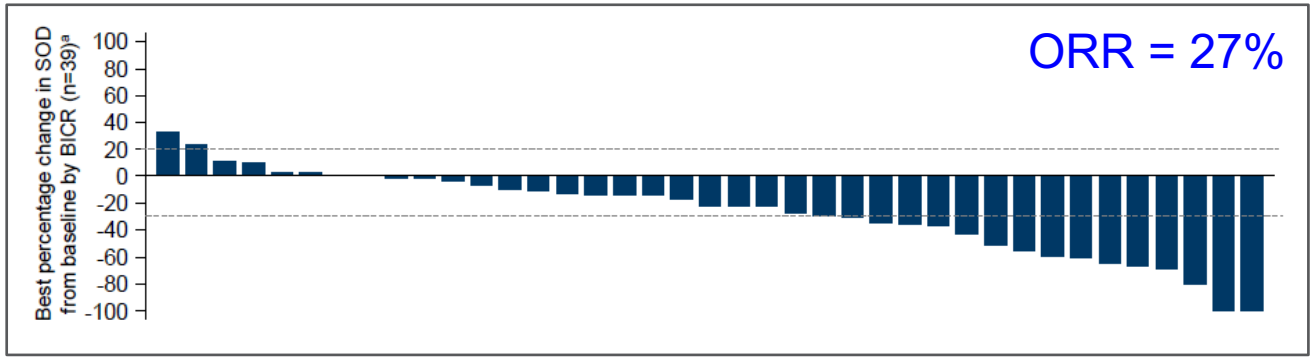
NSCLC[b]
(0.27 to 10 mg/kg IV Q3W)

TNBC[c]
8 mg/kg IV Q3W (n=2); 6 mg/kg IV Q3W (n=42)

Other tumor types
(SCLC, bladder, gastric, esophageal, CRPC, pancreas)

Patient population (n = 41)

- Median prior chemo for MBC = 2 (1-6)
- Prior CDK 4/6i = 95%



Median PFS = 8.3 months
Median OS = NR

SARAH CANNON Research Institute

Meric-Bernstram F et al. SABCS 2022

TROPION-Breast01: Phase 3 trial of Dato-DXd in HR+/HER2- MBC

NCT05104866

Key inclusion criteria

- Patients with HR+/HER2– breast cancer* (HER2– defined as IHC 0/1+/2+; ISH negative)
- Previously treated with 1–2 lines of chemotherapy (inoperable/metastatic setting)
- Experienced progression on ET and for whom ET was unsuitable
- ECOG PS 0 or 1

1:1

Dato-DXd
6 mg/kg IV Day 1 Q3W
(n=365)

ICC
Q3W as per protocol directions† (eribulin mesylate, vinorelbine, capecitabine, or gemcitabine)
(n=367)

Endpoints:

- **Dual primary:** PFS by BICR per RECIST v1.1, and OS
- **Key secondary:** ORR, PFS (investigator assessed) and safety

Patient population

	Dato-DXd	ICC
Prior CDK 4/6 inhibitor	82%	78%
1 prior line of chemo	63%	61%
2 prior lines of chemo	37%	38%
Prior taxane alone	22%	19%
Prior taxane and anthracyclines	65%	67%

@ErikaHamilton9

SARAH CANNON Research Institute

Bardia A et al. ESMO 2023, LBA11

TROPION-Breast01: Progression-free survival

	Dato-DXd	ICC
Median PFS, months (95% CI)	6.9 (5.7–7.4)	4.9 (4.2–5.5)
HR (95% CI)	0.63 (0.52–0.76)	
P-value	<0.0001	

PFS by investigator assessment: Median 6.9 vs 4.5 months; HR 0.64 (95% CI 0.53–0.76)

Subgroup analysis: Consistent benefit across all subgroups with Dato-DXd

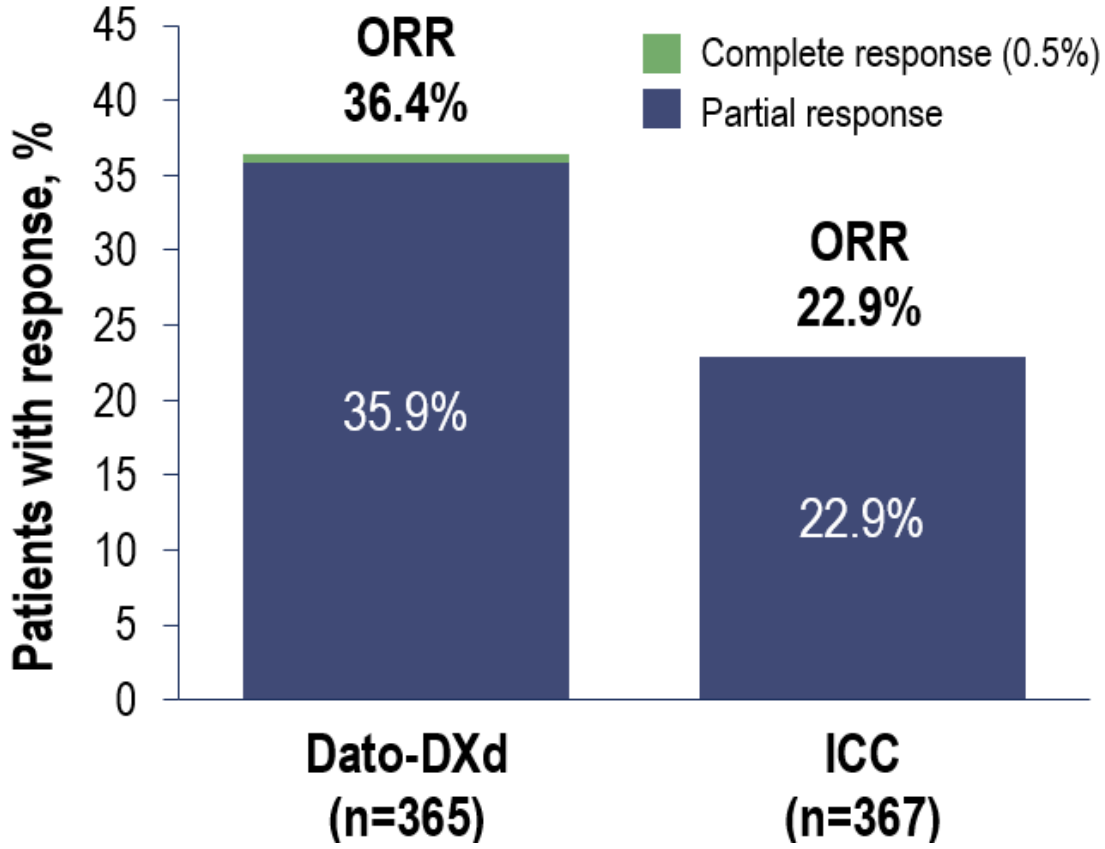
@ErikaHamilton9

SARAH CANNON Research Institute

Bardia A et al. ESMO 2023, LBA11

TROPION-Breast01: ORR and interim OS

Response rate



OS: dual primary endpoint

- OS data were not mature:*
  - Median follow-up 9.7 months
- A trend favouring Dato-DXd was observed:
  - HR 0.84 (95% CI 0.62–1.14)
- The study is continuing to the next planned analysis for OS

@ErikaHamilton9

SARAH CANNON Research Institute

Bardia A et al. ESMO 2023, LBA11

TROPION-Breast01: Safety and summary

- Most frequent TRAEs with Dato-DXd were nausea (51%) and stomatitis (50%)
- Most common TRAEs with ICC were neutropenia (42%) and nausea (24%)

Adverse events of special interest

All-cause events, n (%)	Dato-DXd (n=360)	ICC (n=351)
Oral mucositis/stomatitis*		
All grades	211 (59)	61 (17)
Grade 3†	25 (7)	9 (3)
Ocular events‡		
All grades	175 (49)	81 (23)
Grade 3†	3 (1)	0
Adjudicated drug-related ILD§		
All grades	9 (3)	0
Grade ≥3	2 (1)	0
Infusion-related reactions		
All grades	32 (9)	12 (3)
Grade 3†	1 (0.3)	0

- Median treatment duration: **6.7** (Dato-DXd) and **4.1** months (ICC)
- Rate of grade ≥3 TRAEs in the Dato-DXd group was less than half that in the ICC group
- Fewer TRAEs leading to dose reductions or interruptions with Dato-DXd compared with ICC

- ✓ Significant improvement in PFS with Dato-DXd in pre-treated HR+/HER2- MBC
- ✓ Trend towards OS benefit with Dato-DXd at interim analysis
- ✓ No new safety signals observed with Dato-DXd
- ✓ Data suggest promise of a new treatment option for pts with HR+/HER2- MBC who have been treated with prior chemo

SARAH CANNON Research Institute

Bardia A et al. ESMO 2023, LBA11

SKB264 (MK-2870): another novel TROP2 ADC

- SKB264 (MK-2870) comprises
  - a TROP2 antibody
  - a belotecan-derivative topo I inhibitor
  - a sulfonyl pyrimidine-CL2A-carbonate linker

to achieve an average DAR of 7.4

- The design was to achieve a more effective balance between stability in circulation and release of the ADC payload in tumor cells

- **Phase 1/ 2 basket study** in adv solid tumors included

  Pts with HR+/HER2- MBC, 66% treated with prior CDK 4/6i and a median of 2 prior chemo received SKB264 5mg/kg every 2weeks

  Safety: Mainly heme tox, mostly within first 2 months of tx and pts recovered following G-CSF tx

  No neuropathy, ocular toxicity, or drug-related ILD/pneumonitis reported

	All patients (N=38)[a]
ORR, n (%)	**14 (36.8)**
Confirmed PR	12
DCR, n (%)	**34 (89.5)**
DoR	
Median (Range), mo	7.4 (4.2~14.9+)
6-mon DoR rate, % (95% CI)	80.0 (40.9, 94.6)
PFS	
Median (95% CI), mo	11.1 (5.4, 13.1)
6-mon PFS rate, % (95% CI)	61.2 (41.3, 76.1)
OS	
Median (95% CI), mo	NE (10.71, NE)
9-mon OS rate (95% CI), %	81.4 (57.1, 92.7)

a. Of patients enrolled, 38 patients were evaluable for response assessment (defined as ≥1 on-study scan).

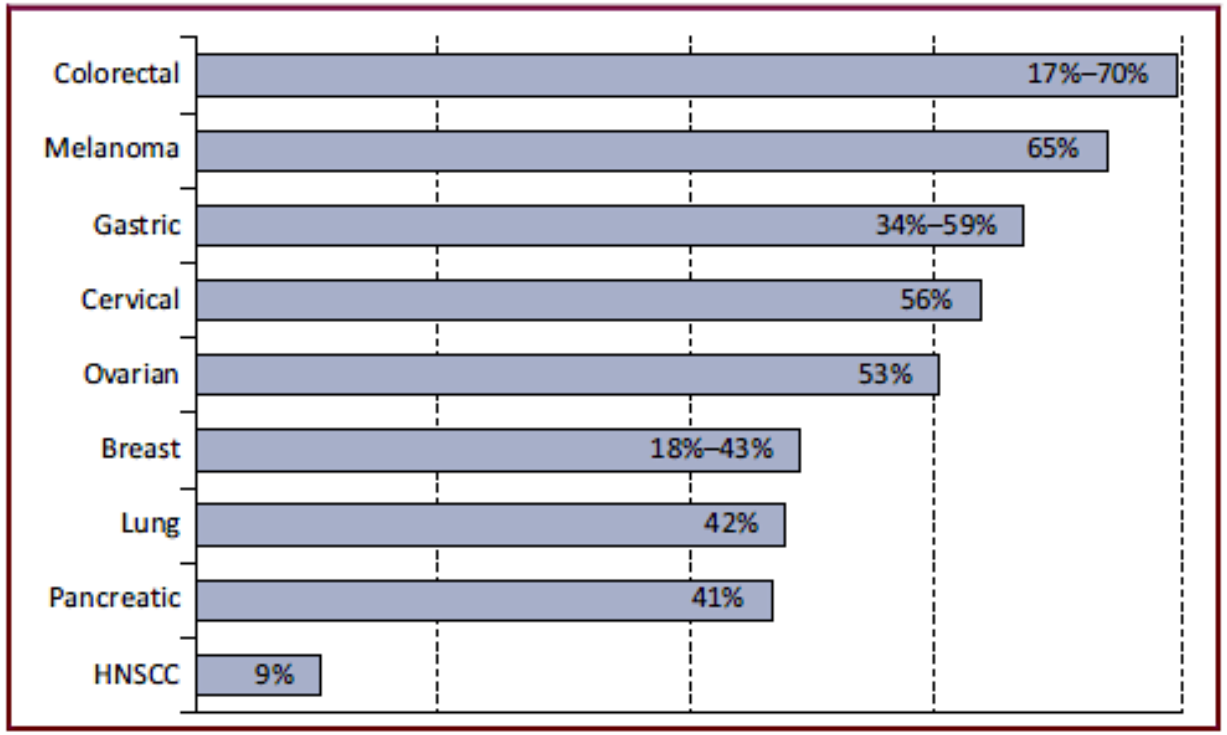
Yin Y et al. ESMO 2023

Patritumab deruxtecan (HER3-DXd)

SARAH CANNON
Research Institute

HER3 - role in cancer

Rate of HER3 expression in different tumor types



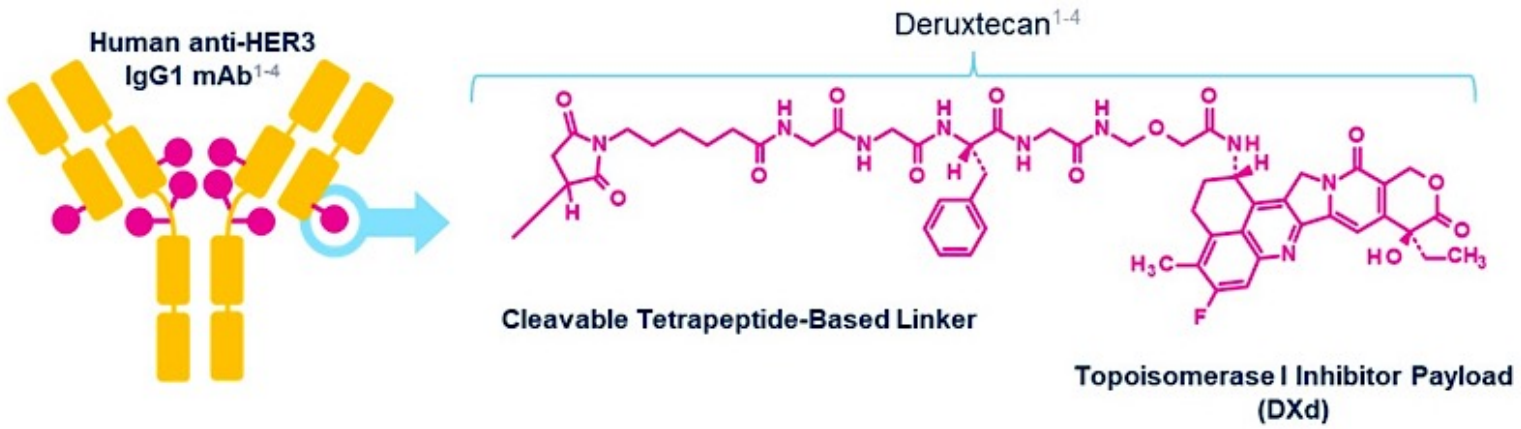
- HER3 is a tyrosine kinase receptor belonging to the HER family of receptors
  - has poor if no intracellular kinase activity
  - forms heterodimers preferentially with HER2 and/or EGFR leading to activation of the downstream signaling pathways promoting oncogenesis
  - is overexpressed in many types of cancers including ~20-50% of breast cancers
  - Overexpression of HER3 in breast cancer is associated with poor prognosis

SARAH CANNON Research Institute

Uliano J et al. 2023; Weng W et al. 2023

Patritumab deruxtecan (HER3-DXd)

- HER3-DXd is an ADC with 3 components[1-6]:
  - A fully human anti-HER3 IgG1 mAb (patritumab), covalently linked to
  - A topoisomerase I inhibitor payload, an exatecan derivative, via
  - A tetrapeptide-based cleavable linker



7 Key Attributes of HER3-DXd

Payload mechanism of action: topoisomerase I inhibitor [a,1-4]
High potency of payload [a,1-4]
High drug to antibody ratio ≈ 8 [a,1,2]
Payload with short systemic half-life [a,b,2,3]
Stable linker-payload [a,2-4]
Tumor-selective cleavable linker [a,1-5]
Bystander antitumor effect [a,2,6]

HER, human epidermal growth factor receptor; IgG1, immunoglobulin G1; mAb, monoclonal antibody.
[a] The clinical relevance of these features is under investigation. [b] Based on animal data.

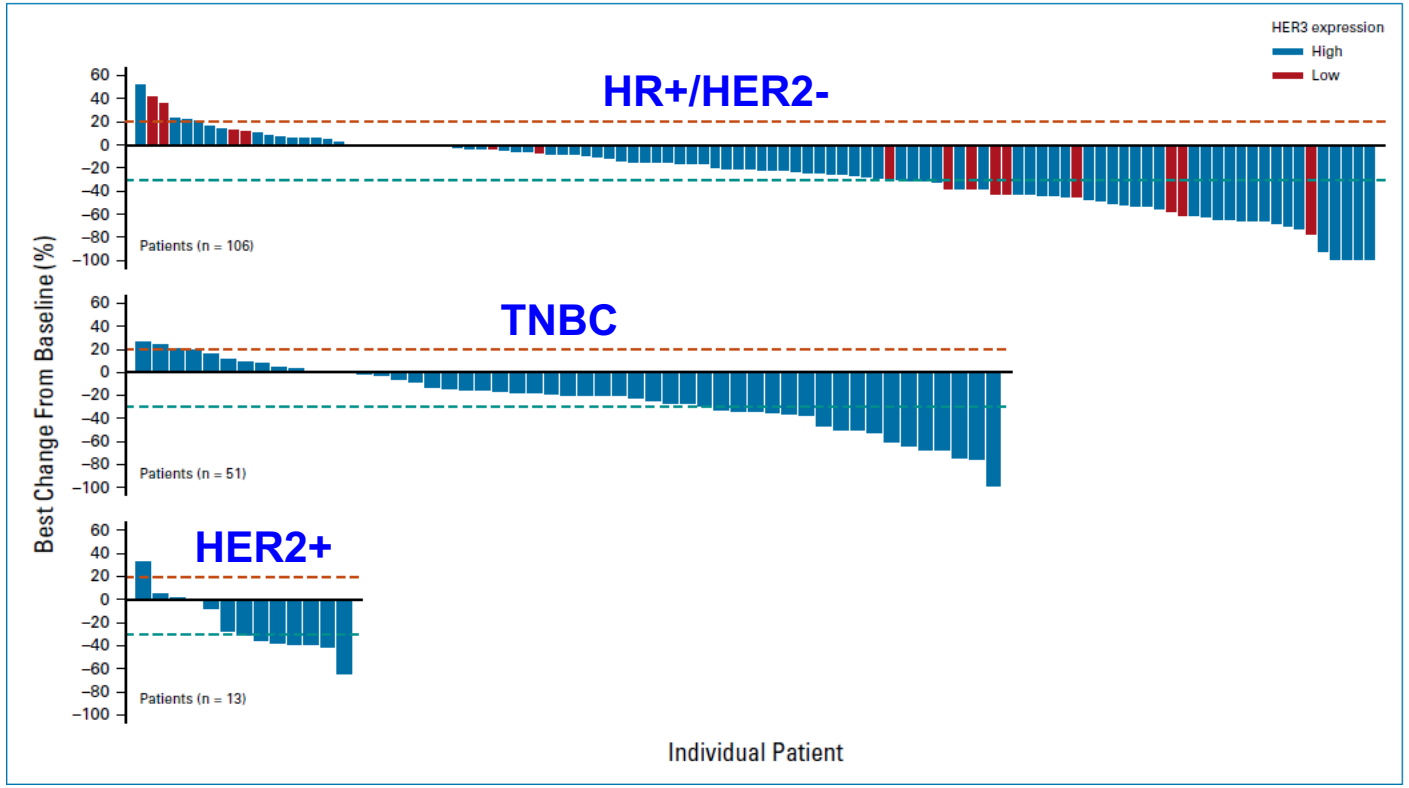
SARAH CANNON Research Institute

Krop I et al. ASCO 2022, Abstract 1002

Patritumab deruxtecan: Activity in HER3-expressing MBC

- Phase 1/ 2 trial (expansion) in HER3-expressing MBC:
  - Heavily pretreated patient population with median priors ranging from 2-6 depending on subtype

Change in tumor size from baseline



Subtype	ORR	Median DoR
HR+/HER2-	30%	7.4 mo
HER2+	43%	11 mo
TNBC	23%	5.5 mo

- ✓ **Durable antitumor activity in all BC subtypes across the range of HER3 expression**
- ✓ **Manageable safety profile with low rates of treatment discontinuation**
- ✓ **Treatment related ILD (6.6%), mostly G1/2; one G5 event**

@ErikaHamilton9

Krop I et al. JCO 2023

ICARUS-BREAST01: Phase 2 trial of HER3-DXd (Patritumab deruxtecan) in HR+/HER2- MBC

Prospective, multicenter, single-arm study with multiple biomarker analyses

- LA/MBC
- HR+/HER2- or HER2-low
- PD on CDK 4/6i+ET
- PD on 1 prior chemo for MBC
- No prior T-DXd

N = 56

→ **Patritumab deruxtecan**
5.6mg/kg IV q 3 weeks

Pre treatment, on tx and EOT biopsy and blood collected

*HER3-expression prescreening (75% of membrane positivity at 10x) was removed by amendment on April 21st, 2022

Patient population:

Median prior regimens	2
Prior (neo)adj chemotherapy	65%
Prior everolimus	32%
BL HER3 expression (≥75%)	51.8%
BL HER3 expression unknown	48.2%

Tumor response by 3 months from treatment initiation, n (%)	
Partial Response*	16 (28.6)*
Stable Disease	30 (53.6)
Progressive Disease	10 (17.8)

@ErikaHamilton9

SARAH CANNON Research Institute

Pistilli B et al. ESMO Breast 2023

Phase 2 trial of HER3-DXd in HER2- MBC

- LA/MBC
- TNBC: 1-3 prior lines of chemo for MBC
- HR+: Prior tx with CDK 4/6i +ET; no more than 2 prior chemo for MBC
- Pre- and on-treatment biopsies

N = 60

→ **Patritumab deruxtecan**
5.6mg/kg IV q 3 weeks

Pre treatment* biopsy tissue analyzed for ER/PR/HER2 and HER3 expression

Patient population:

Median prior regimens	3
Prior chemotherapy	90%
Prior immunotherapy	20%
Prior Sacituzumab	8.3%
BL HER3 expression (≥75%)	63.8%
BL HER3 expression (25-74%)	27.7%

Membrane HER3 expression	≥75% (N=30)	25%-74% (N=13)	<25% (N=4)	Unknown * (N=13)	Total (N=60) N (%)
ORR, n (%)	10 (33.3)	6 (46.2)	2 (50.0)	3 (23.1)	21 (35.0)
CBR, n (%)**	12 (40.0)	7 (53.8)	2 (50.0)	5 (38.5)	26 (43.3)
DoR ≥6 months, n (%)†	4 (40.0)	2 (33.3)	2 (100)	2 (66.7)	10 (47.6)

*HER3 results available for 47 pts. Remaining 13 pts had tissue not available/testing result unevaluable

All-comer ORR was 35%, overall CBR was 43%, and DoR was at least 6 months in nearly half of all patients who responded

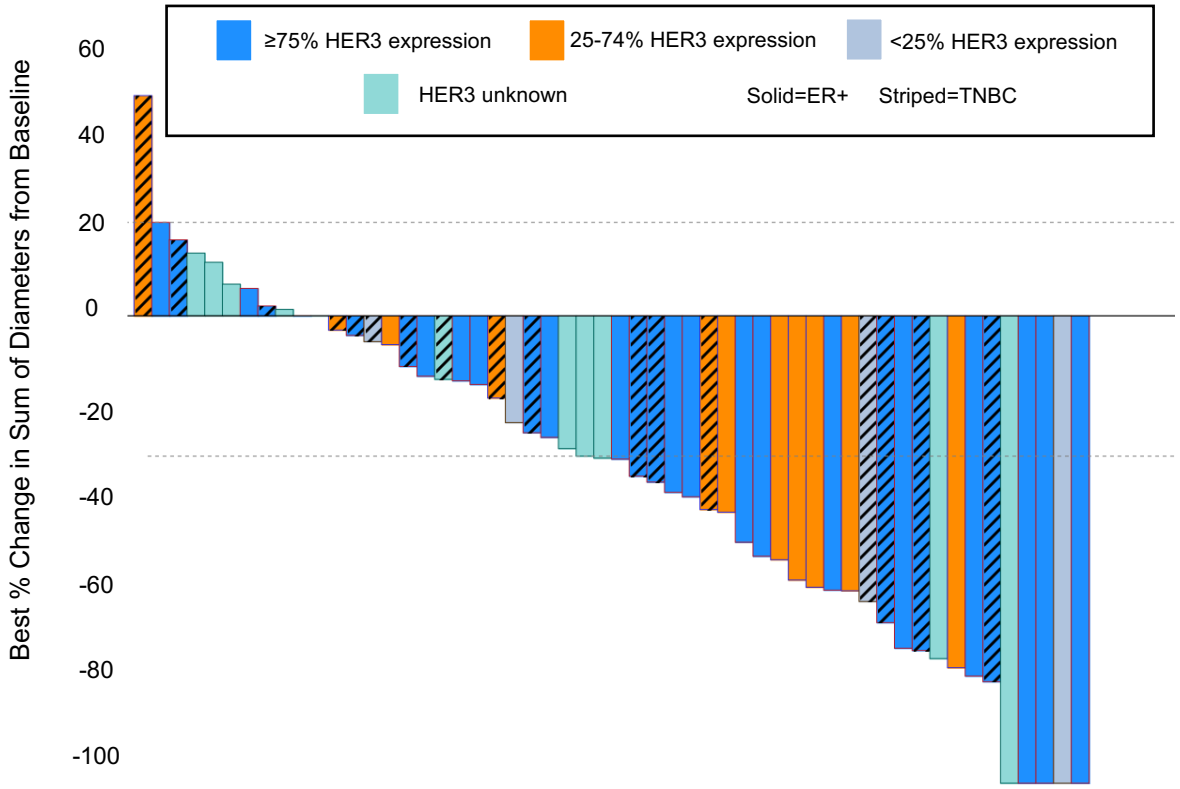
@ErikaHamilton9

SARAH CANNON Research Institute

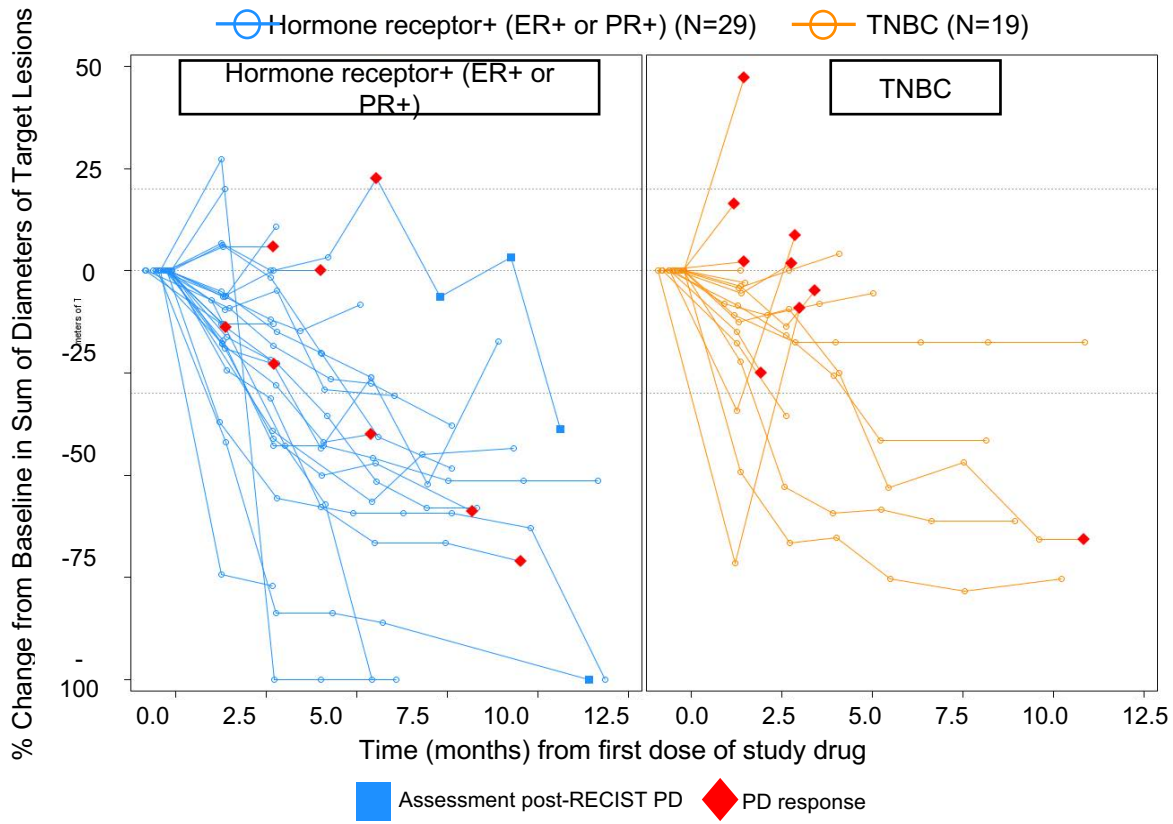
Hamilton E et al. ASCO 2023

Tumor shrinkage with HER3-DXd (Patritumab deruxtecan)

Best Percent Change in Sum of Diameters from Baseline in Target Lesions



Percent Change from Baseline in Sum of Diameters of Target Lesions
HR+ vs TNBC



Majority of the patients had tumor shrinkage with HER3-DXd treatment

SARAH CANNON Research Institute

Hamilton E et al. ASCO 2023

HER3-DXd (Patritumab deruxtecan) for HR+/HER2- MBC: Key takeaways

- ✓ HER3-DXd is active in HR+/HER2- MBC, irrespective of level of HER3 expression
  - ORR 30-35% across both trials

- ✓ Biomarker analyses (ICARUS-BREAST01):
  - clinical activity seen regardless of most frequent genomic alterations
  - RNAseq showed a higher modulation of gene expression in early responders as compared to non-responders: is primary resistance more related to reduced ADC internalization/binding?

- ✓ Fatigue and GI toxicity were the most common AEs

- ✓ Rate of ILD was low (1.8%)

- ✓ These data warrant further exploration of HER3-DXD in HR+/HER2- MBC

SHR-A2009: Another novel HER3 ADC

SHR-A2009: novel ADC composed of fully human anti-HER3 IgG1 mAb, covalently linked to a DNA topoisomerase I inhibitor via a cleavable peptide linker (DAR=4)

FIH trial in patients with advanced solid tumors (NCT05114759)

- Majority of pts enrolled had NSCLC (36/42)
- No DLTs reported (up to dose level 10.5mg/kg q 3 weeks
- Most common toxicities: anemia, neutropenia and nausea
- ORR: 25% (all tumors); 30% (NSCLC)
- Median DoR: 7 months

Trial ongoing to assess higher doses of SHR-A2009

Other novel agents for HR+/HER2- MBC

SARAH CANNON
Research Institute

Novel agents under evaluation in ER+/HER2- MBC

ER-PROTAC: heterobifunctional molecules that degrade ER via the ubiquitin proteasome system
Catalytic in their MOA; can promote target degradation at low concentrations; less toxicity & higher therapeutic index
ARV-471 (Vepdegestrant) single agent in phase 3 trials in ER+/HER2- MBC NCT05654623; NCT05909397
AC0699 : Chimeric ER degrader in phase 1 trials NCT05654532

CERAN: shuts down both activation functions (AF1 and AF2) of the ER
OP-1250 (Palazestrant) in phase 3 trial in ER+/HER2- MBC NCT06016738

Novel SERM: Modulate ER by altering its conformation and thus its interaction with ER coactivators and co-repressors
Lasofoxifene: Phase 3 trial in combination with abemaciclib NCT05696626

SARM: Selective AR modulator. AR is expressed in 70-95% of ER+ BC
it is a tumor suppressor & its expression is associated with improved prognosis in ER+ BC
RAD140: oral breast-tissue selective AR agonist; preliminary activity in phase 1 trial in ER+/HER2- MBC NCT03088527
EP0062 (Vosilasarm- AR agonist): Phase 1 trial ongoing in AR+/ER+/HER2- MBC NCT05573126
Enobosarm: (AR agonist) Phase 3 trial in AR+/ER+/HER2- MBC NCT04869943

CDK4 inhibitor: Selective inhibition of CDK4 with significant sparing of CDK6 reduces neutropenia and enables higher doses to be administered
PF-07220060: Phase 3 trial in combination with fulvestrant planned NCT06105632

CDK2 inhibitor: CDK2 inhibition effective in tumors with cyclinE overexpression/amplification, a key CDK4/6i resistance mechanism
BLU-222: Phase 1/ 2 trial ongoing with preliminary antitumor activity in heavily pretreated ER+/HER2- MBC reported recently NCT05252416
ARTS-021: First-in-human study ongoing in CCNE1 altered malignancies including ER+/HER2- MBC NCT05867251
