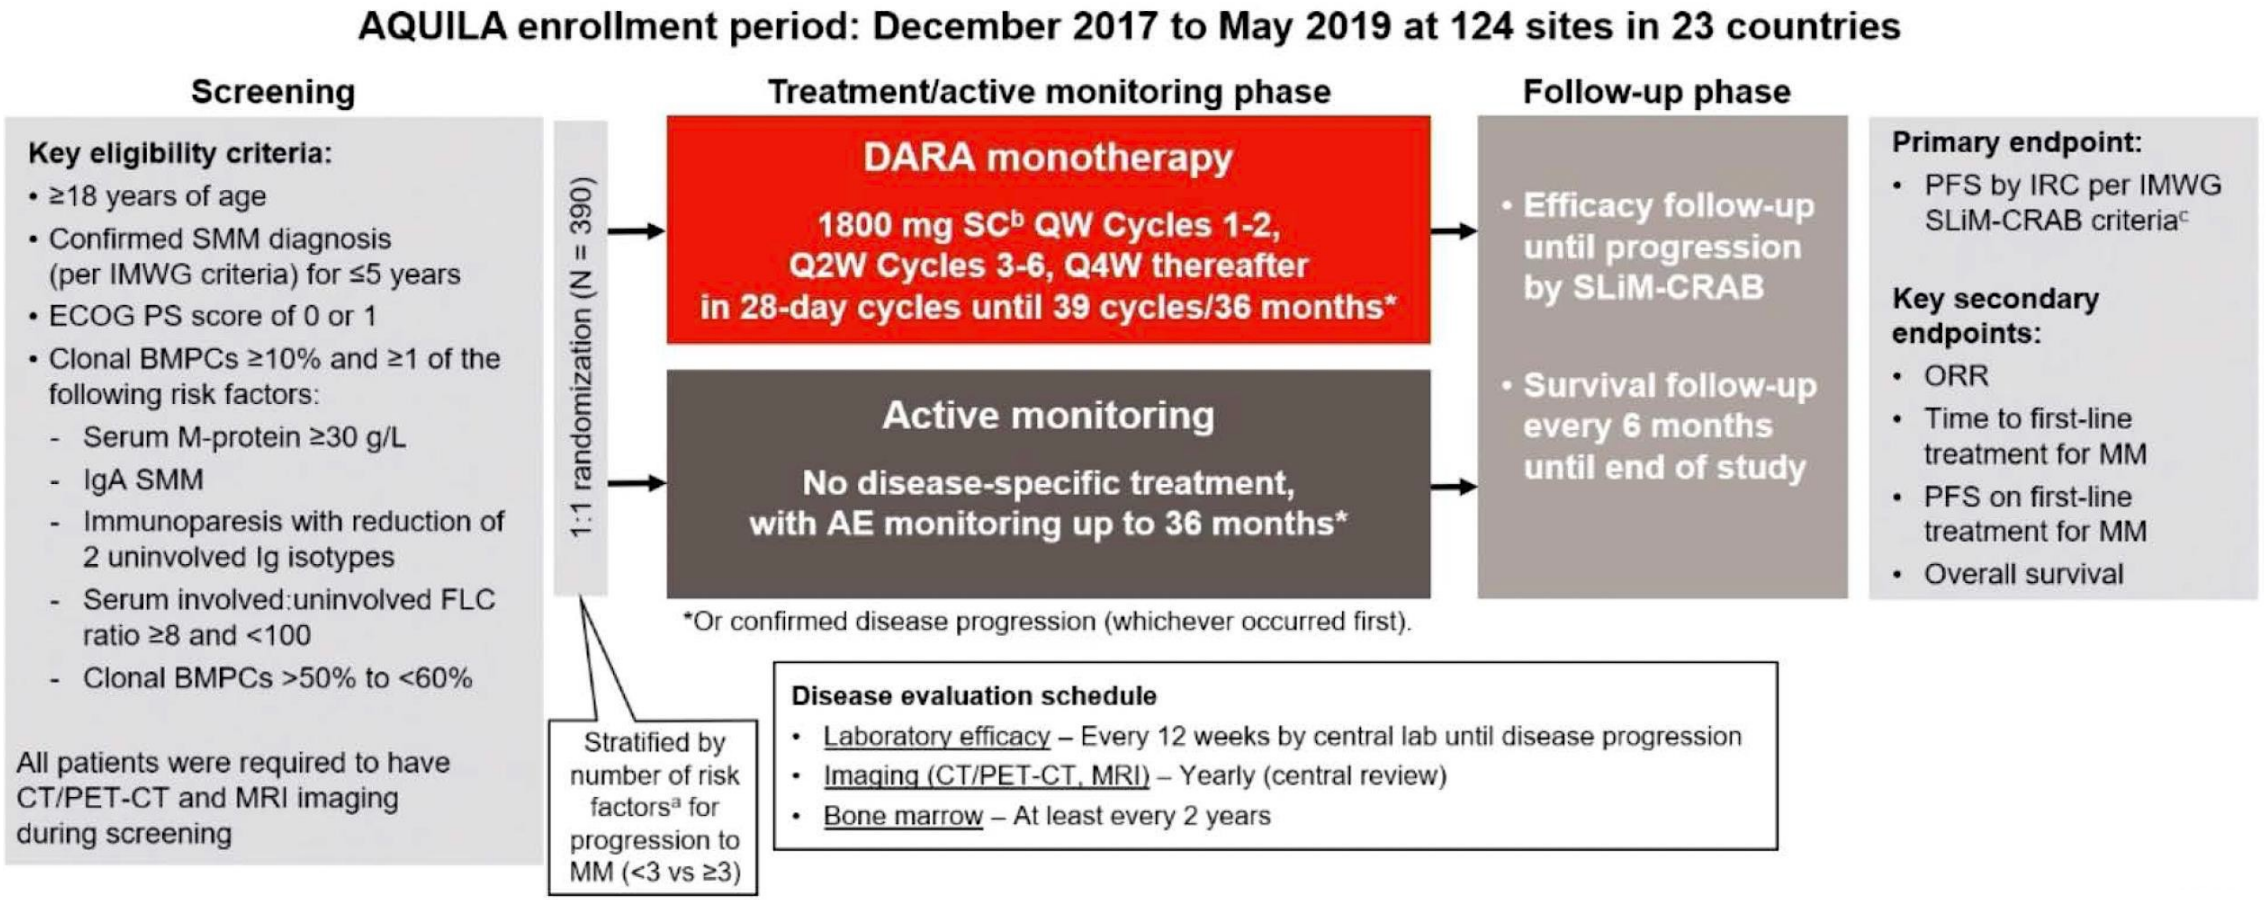
Disclosures

No relevant conflicts of interest to disclose.

AQUILA: Study Design



IMWG, International Myeloma Working Group; ECOG PS, Eastern Cooperative Oncology Group performance status; BMPC, bone marrow plasma cell; FLC, free light chain; CT, computed tomography; MRI, magnetic resonance imaging; QW, weekly; Q2W, every 2 weeks; Q4W, every 4 weeks; AE, adverse event; IRC, independent review committee; ORR, overall response rate. [a]Risk factors included involved:uninvolved FLC ratio ≥8 (yes vs no), serum M-protein ≥30 g/L (yes vs no), IgA SMM (yes vs no), immunoparesis (reduction of 2 uninvolved immunoglobulins vs other), or clonal BMPCs (>50% to <60% vs ≤50%). [b]DARA SC (1800 mg co-formulated with recombinant human hyaluronidase PH20 [rHuPH20; 2,000 U/mL; ENHANZE® drug delivery technology; Halozyme, Inc.]). [c]PFS was defined as duration from randomization to initial documented progression to active MM or death due to any cause, whichever occurred first.

Dimopoulos. ASH 2024. Abstr 773. Dimopoulos. NEJM. 2024;[Epub].

AQUILA: Baseline Disease Characteristics and Patient Disposition

Characteristic	DARA (n = 194)	Active monitoring (n = 196)
Age		
Median (range), years	63.0 (31-86)	64.5 (36-83)
18 to <65 years, n (%)	106 (54.6)	98 (50.0)
65 to <75 years, n (%)	67 (34.5)	74 (37.8)
≥75 years, n (%)	21 (10.8)	24 (12.2)
Sex, n (%)		
Female	99 (51.0)	103 (52.6)
Male	95 (49.0)	93 (47.4)
ECOG PS score, n (%)		
0	165 (85.1)	160 (81.6)
1	29 (14.9)	36 (18.4)
Median time from diagnosis of SMM to randomization (range), years	0.80 (0-4.7)	0.67 (0-5.0)
Median BMPCs (range), %	20.0 (8.0-59.5)	20.0 (10.0-55.0)

Characteristic	DARA (n = 194)	Active monitoring (n = 196)
Type of SMM, n (%)		
IgG	127 (65.5)	138 (70.4)
IgA	55 (28.4)	42 (21.4)
Other	12 (6.2)	16 (8.2)
AQUILA risk factors for progression to MM, n (%)[a]		
<3	154 (79.4)	156 (79.6)
≥3	40 (20.6)	40 (20.4)
Cytogenetic risk profile[b]	n = 167	n = 170
≥1 of del(17p), t(4;14), and/or t(14;16), n (%)	29 (17.4)	22 (12.9)
Mayo 2018 risk criteria, n (%)[c]		
Low	45 (23.2)	34 (17.3)
Intermediate	77 (39.7)	76 (38.8)
High	72 (37.1)	86 (43.9)

Baseline characteristics were generally balanced between groups

[a]Risk factors: serum M-protein ≥30 g/L, IgA SMM, immunoparesis with reduction of 2 uninvolved immunoglobulin isotypes, serum involved:uninvolved FLC ratio ≥8 and <100, or clonal BMPCs >50% to <60% with measurable disease. [b]Cytogenetic risk was assessed by fluorescence in situ hybridization. [c]Mayo 2018 risk criteria: serum M-protein >2 g/L, involved:uninvolved FLC ratio >20, and clonal BMPCs >20%. Patients with 0 factors = low risk, 1 factor = intermediate risk, ≥2 factors = high risk (Lakshman A, et al. *Blood Cancer J.* 2018;8(6):59).

Dimopoulos. ASH 2024. Abstr 773. Dimopoulos. NEJM. 2024;[Epub].

AQUILA: PFS and PD or Deaths by IRC

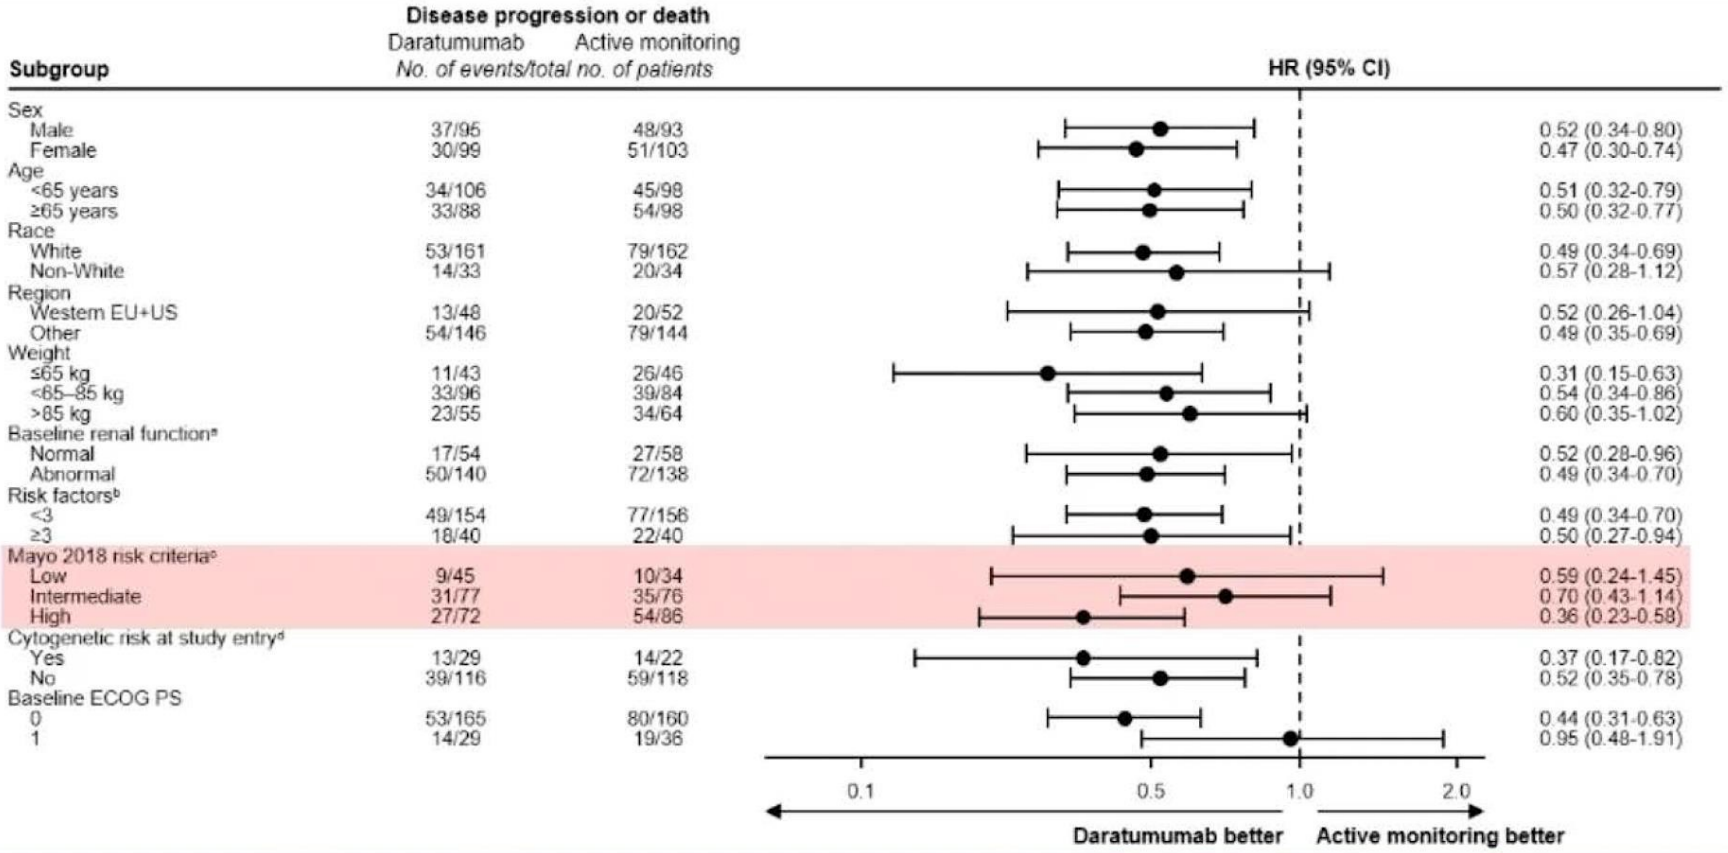
	DARA (n = 194)	Active monitoring (n = 196)
PFS event, n (%)	67 (34.5)	99 (50.5)
Death without disease progression	5 (2.6)	5 (2.6)
Disease progression[a]	62 (32.0)	94 (48.0)
CRAB criteria	12 (6.2)	34 (17.3)
Calcium elevation	0	2 (1.0)
Renal insufficiency[b]	0	0
Anemia	2 (1.0)	14 (7.1)
Bone disease	10 (5.2)	18 (9.2)
SLiM criteria	50 (25.8)	65 (33.2)
Clonal BMPCs	5 (2.6)	16 (8.2)
Serum FLC	33 (17.0)	33 (16.8)
Focal lesion by MRI	12 (6.2)	16 (8.2)

DARA significantly reduced the risk of progression to MM or death by 51% versus active monitoring; the benefit continued beyond 36 months

HR, hazard ratio; CI, confidence interval. [a]A patient may show disease progression based on ≥1 criterion. [b]Some patients met the CRAB criteria for renal insufficiency, but the investigator attributed this to a cause other than disease progression to MM. Adapted with permission © The *New England Journal of Medicine* (2024).

Dimopoulos. ASH 2024. Abstr 773. Dimopoulos. NEJM. 2024;[Epub].

AQUILA: Disease Progression by Subgroups



PFS benefit with DARA was seen across all prespecified subgroups, including all Mayo 2018 risk criteria groups

[a]Normal renal function is a glomerular filtration rate ≥90 mL/min/1.73 m^2. [b]Risk factors were serum M-protein ≥30 g/L, IgA SMM, immunoparesis with reduction of 2 uninvolved immunoglobulin isotypes, serum involved:uninvolved FLC ratio ≥8 and <100, or clonal BMPCs >50% to <60% with measurable disease. [c]Mayo 2018 risk was retrospectively assessed; criteria included serum M-protein >2 g/L, involved:uninvolved FLC ratio >20, and clonal BMPCs >20%. Patients with 0 factors = low risk, 1 factor = intermediate risk, ≥2 factors = high risk (Lakshman A, et al. *Blood Cancer J.* 2018;8(6):59). [d]Cytogenetic risk was assessed by fluorescence in situ hybridization; "yes" = presence of del(17p), t(4;14), or t(14;16) and "no" = testing for these probes but no abnormality. Reproduced with permission © The *New England Journal of Medicine* (2024).

Dimopoulos. ASH 2024. Abstr 773. Dimopoulos. NEJM. 2024.

AQUILA: OS

	DARA (n = 194)	Active monitoring (n = 196)
Deaths, n (%)	15 (7.7)	26 (13.3)
Primary cause, n		
Disease progression	3	9
AE	2	4
Other*	10	13

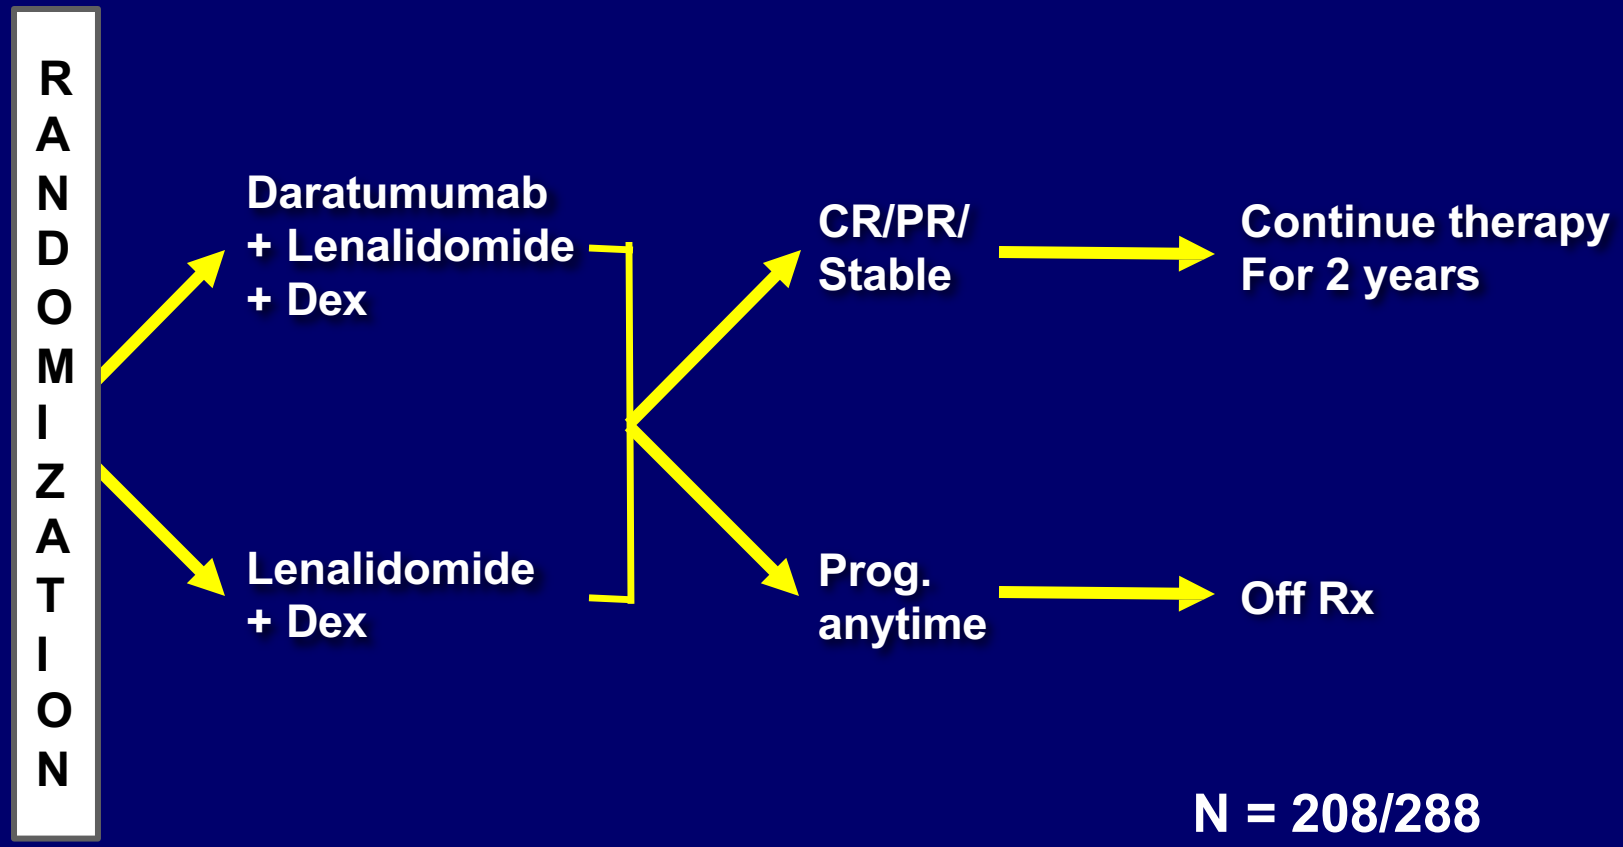
*Deaths due to an event occurring after the AE reporting window (ie, events that happened after patient started subsequent therapy or >30 days after last dose) or deaths with unknown reason.

Early intervention with fixed duration DARA extended overall survival versus active monitoring

Dimopoulos. ASH 2024. Abstr 773. Dimopoulos. NEJM. 2024;[Epub].

Smoldering MM

EAA173: Phase III –Daratumumab to Enhance Therapeutic Effectiveness of Lenalidomide in Smoldering Myeloma (DETER-SMM)(PI: NC)

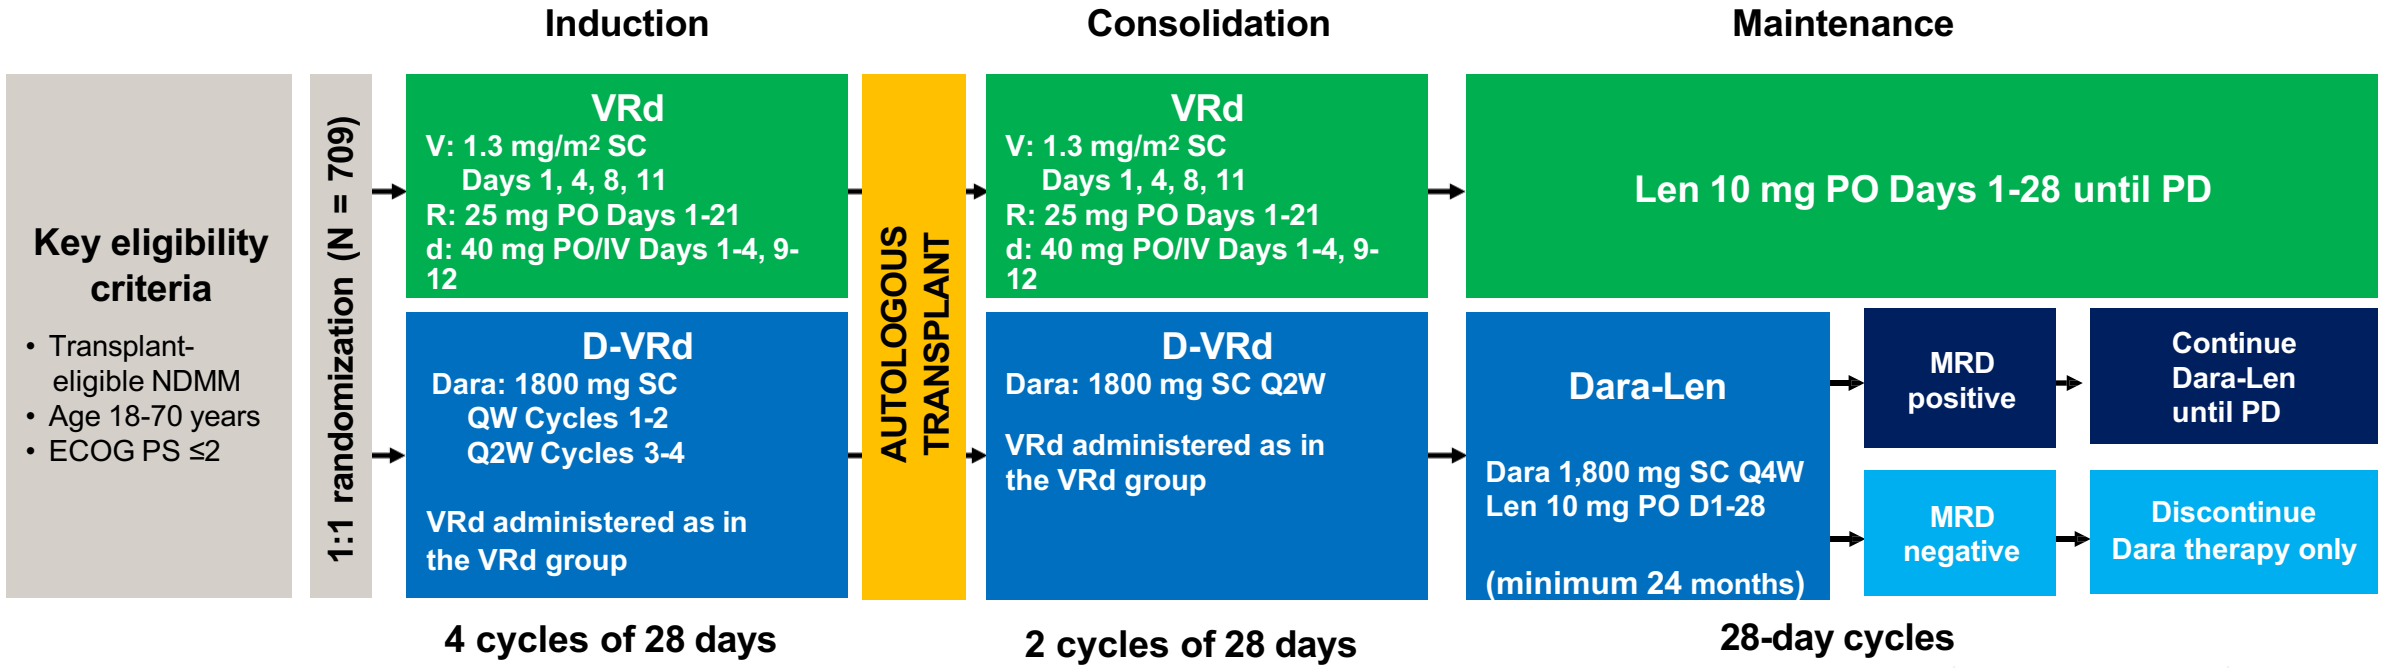


N = 208/288

PI: Natalie Callander

(Activated 4/30/20 19)

Phase III PERSEUS: Study Design: era of quadruplet induction, ASCT, maintenance



Primary endpoint: PFS

Key secondary endpoints: Overall ≥CR rate, overall MRD-negativity rate, OS

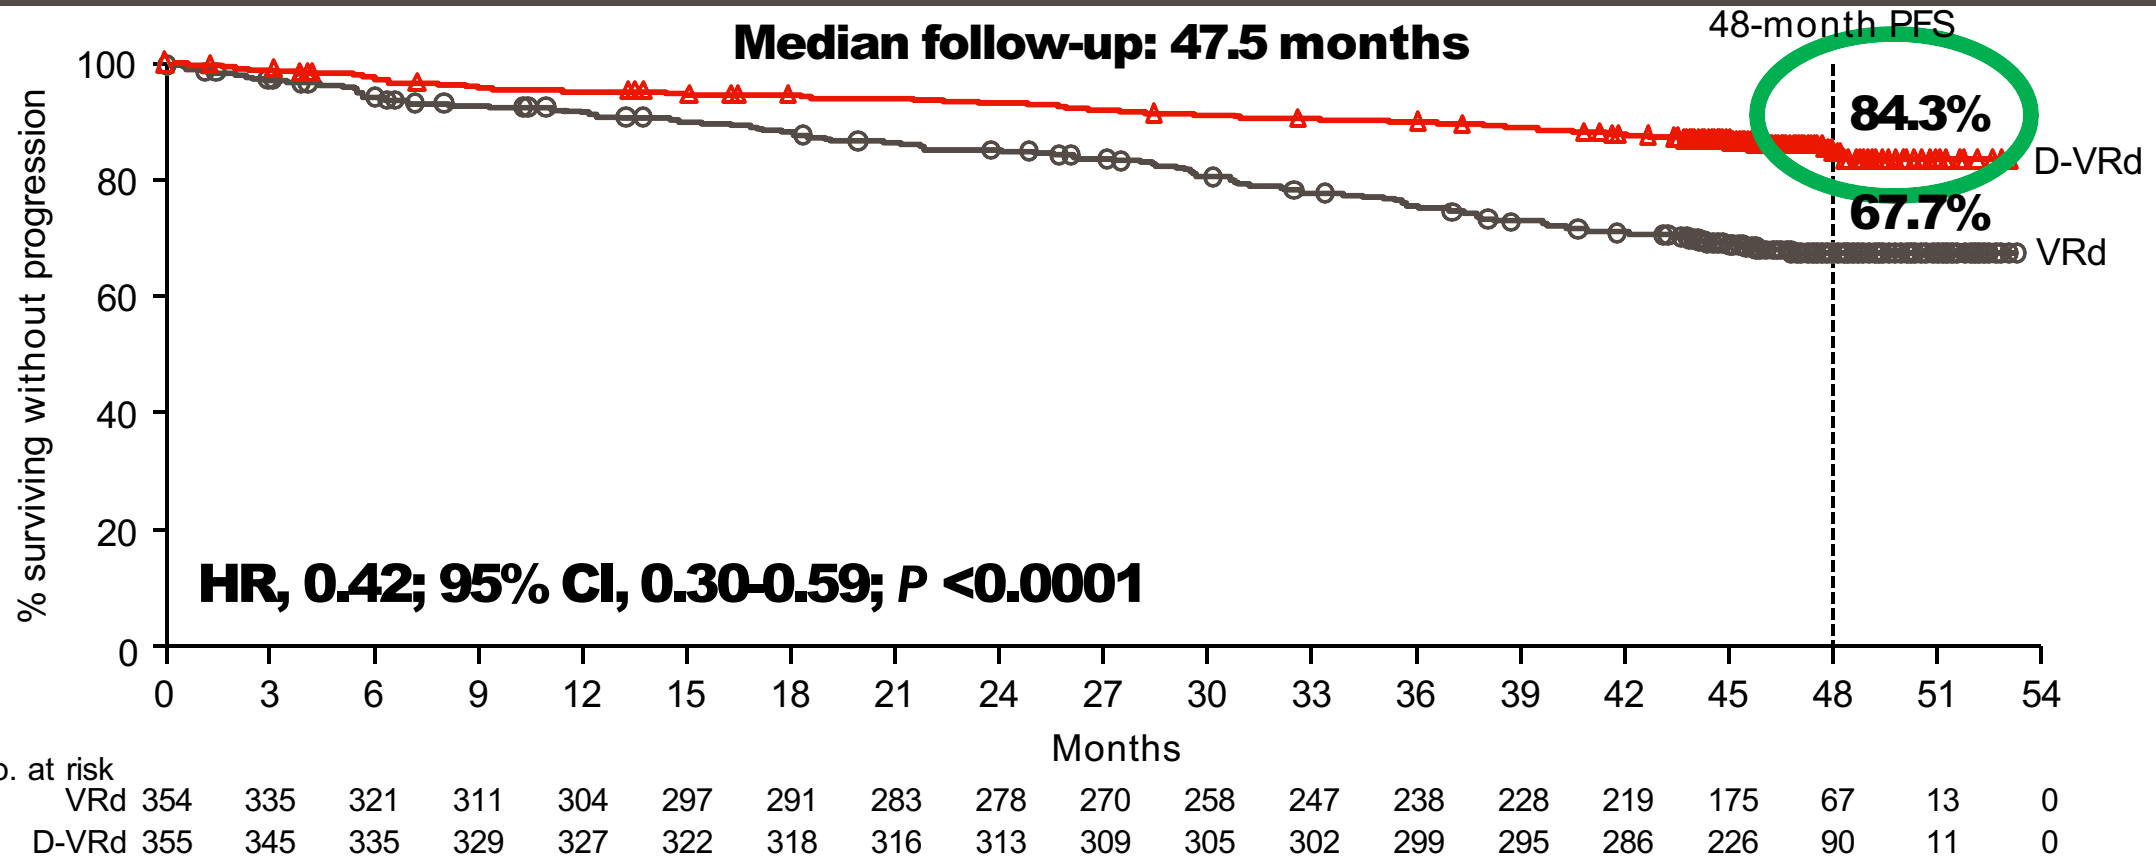
Discontinue Dara therapy only after ≥24 months of D-R maintenance for patients with ≥CR and 12 months of (sustained) MRD negativity

Restart Dara therapy upon confirmed loss of CR without PD or recurrence of MRD

MRD was assessed using the clonoSEQ assay in patients with ≥VGPR post-consolidation and at the time of suspected ≥CR. Overall, the MRD-negativity rate was defined as the proportion of patients who achieved both MRD negativity (10^{-5} threshold) and ≥CR at any time.

P Sonneveld NEJM 2024

PERSEUS: Progression-free Survival

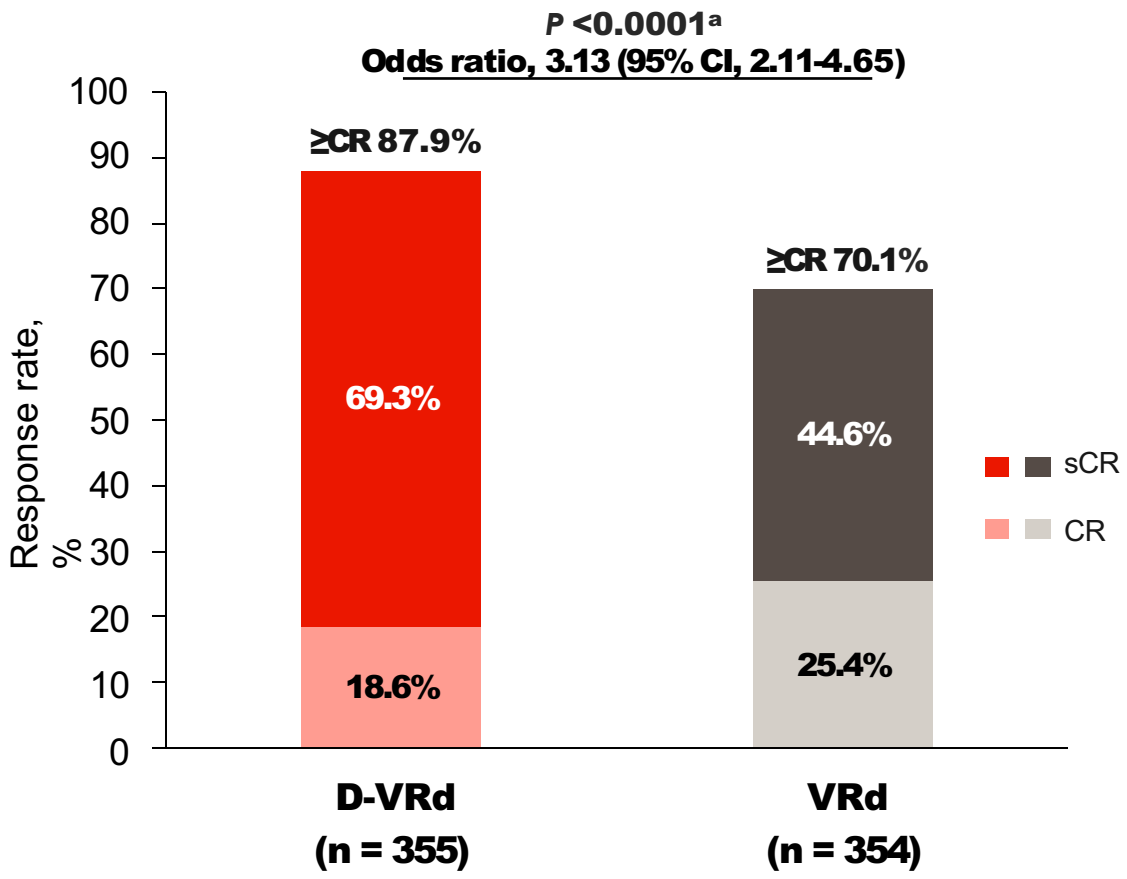


- **58% reduction in the risk of progression or death in patients receiving D-VRd**
- **66% of patients were able to STOP daratumumab after 2 years**

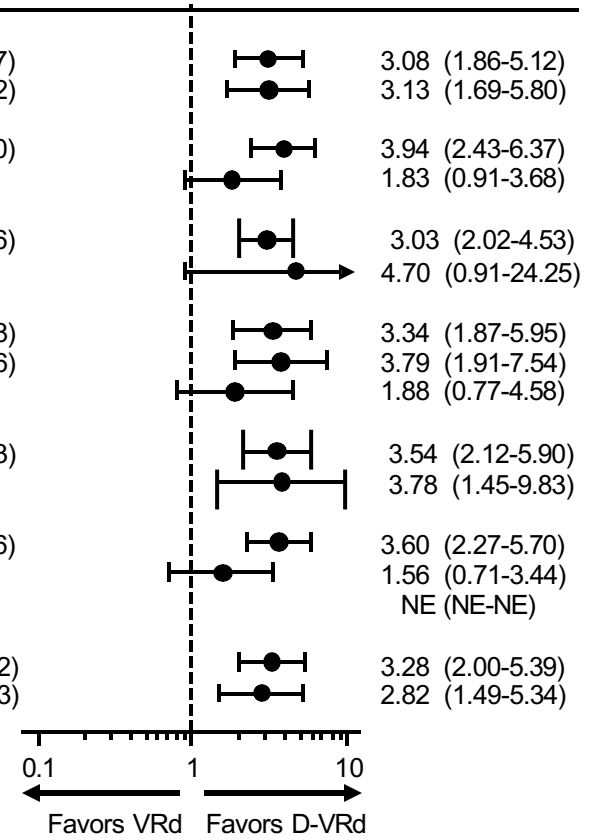
HR, hazard ratio; CI, confidence interval.

Presented by P Sonneveld at the 65th American Society of Hematology (ASH) Annual Meeting; December 9-12, 2023; San Diego, CA, USA

PERSEUS: Overall ≥CR Rates



Subgroup	VRd no. of patients with ≥CR/total no. (%)	D-VRd no. of patients with ≥CR/total no. (%)	Odds ratio (95% CI)
Sex			
Male	143/205 (69.8)	185/211 (87.7)	3.08 (1.86-5.12)
Female	105/149 (70.5)	127/144 (88.2)	3.13 (1.69-5.80)
Age			
<65 y	186/267 (69.7)	235/261 (90.0)	3.94 (2.43-6.37)
≥65 y	62/87 (71.3)	77/94 (81.9)	1.83 (0.91-3.68)
Race			
White	226/323 (70.0)	289/330 (87.6)	3.03 (2.02-4.53)
Other	22/31 (71.0)	23/25 (92.0)	4.70 (0.91-24.25)
ISS stage			
I	129/178 (72.5)	167/186 (89.8)	3.34 (1.87-5.95)
II	84/125 (67.2)	101/114 (88.6)	3.79 (1.91-7.54)
III	34/50 (68.0)	44/55 (80.0)	1.88 (0.77-4.58)
Type of MM			
IgG	122/185 (65.9)	178/204 (87.3)	3.54 (2.12-5.90)
Non-IgG	73/96 (76.0)	72/78 (92.3)	3.78 (1.45-9.83)
Cytogenetic risk			
Standard risk	182/266 (68.4)	234/264 (88.6)	3.60 (2.27-5.70)
High risk	59/78 (75.6)	63/76 (82.9)	1.56 (0.71-3.44)
Indeterminate	7/10 (70.0)	15/15 (100)	NE (NE-NE)
ECOG PS			
0	160/230 (69.6)	195/221 (88.2)	3.28 (2.00-5.39)
≥1	88/124 (71.0)	117/134 (87.3)	2.82 (1.49-5.34)

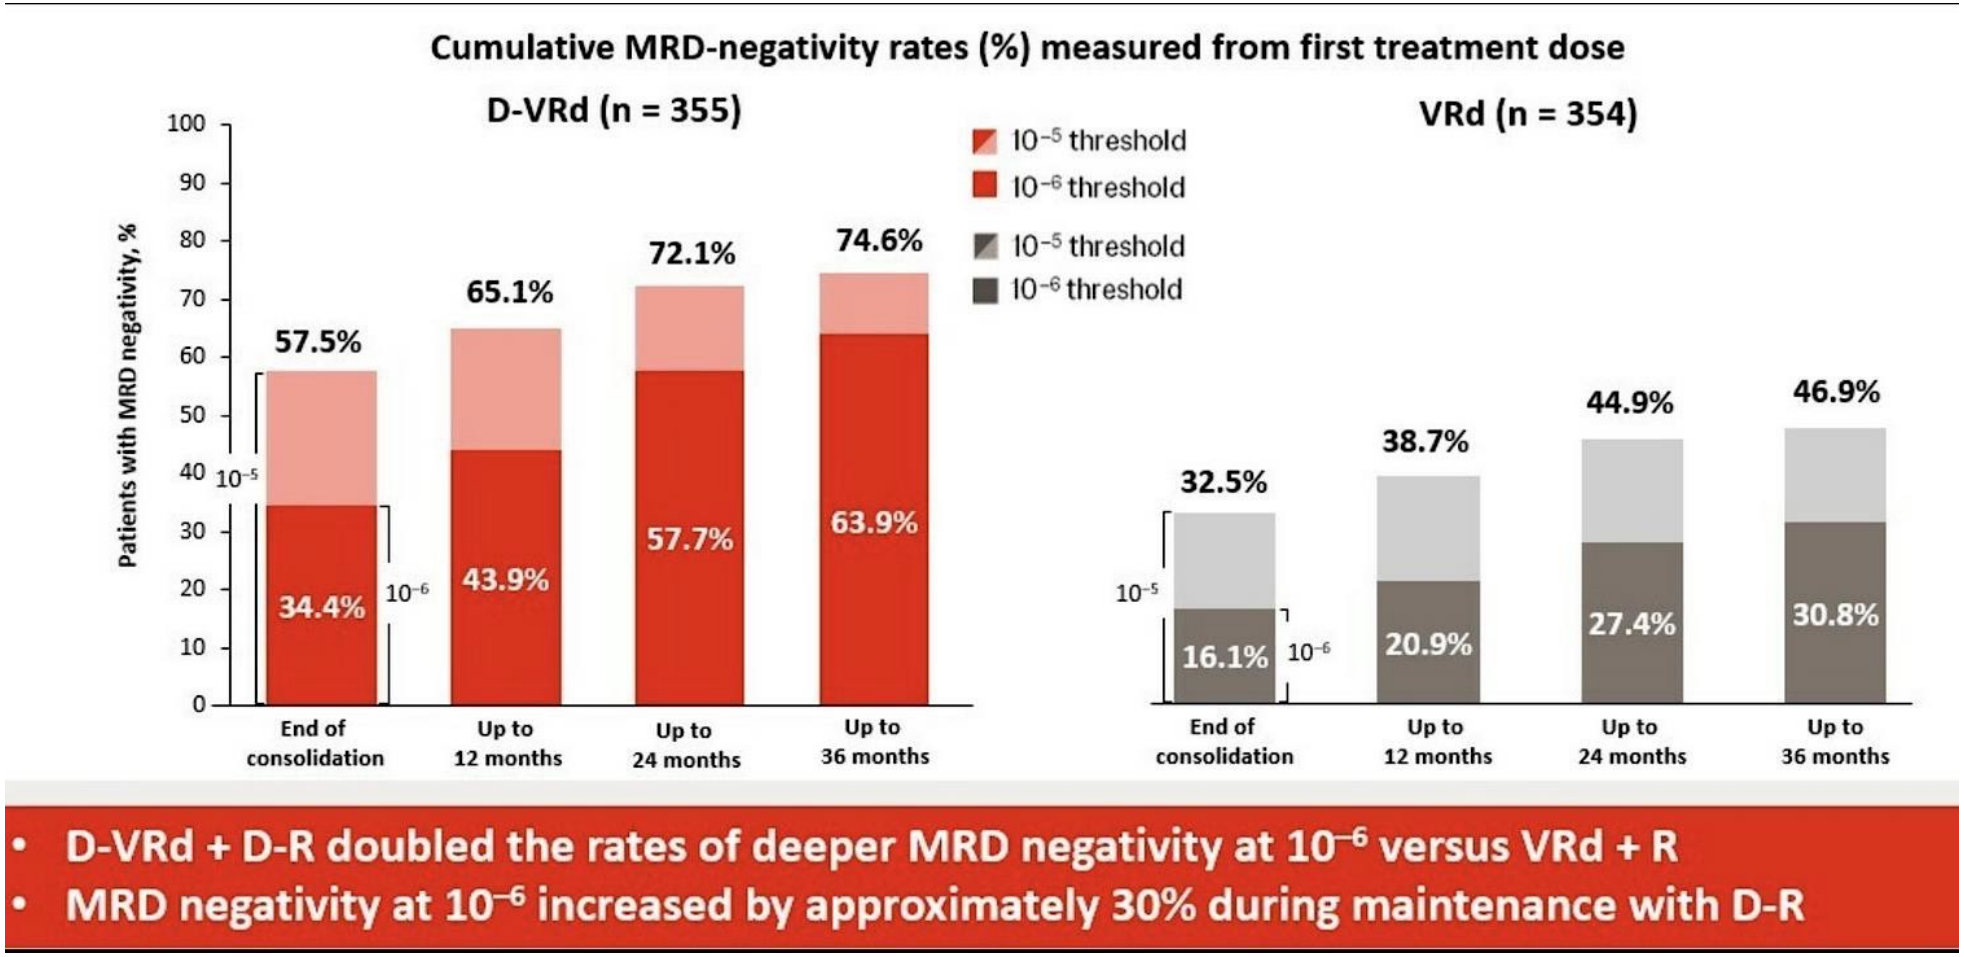


- **Overall ≥CR rate was significantly higher with D-VRd versus VRd**
- **≥CR rate was improved with D-VRd versus VRd across subgroups**

sCR, stringent complete response; NE, not estimable. [a]*P* value (2-sided) was calculated with the use of the stratified Cochran–Mantel–Haenszel chi-squared test.

Presented by P Sonneveld at the 65th American Society of Hematology (ASH) Annual Meeting; December 9-12, 2023; San Diego, CA, USA

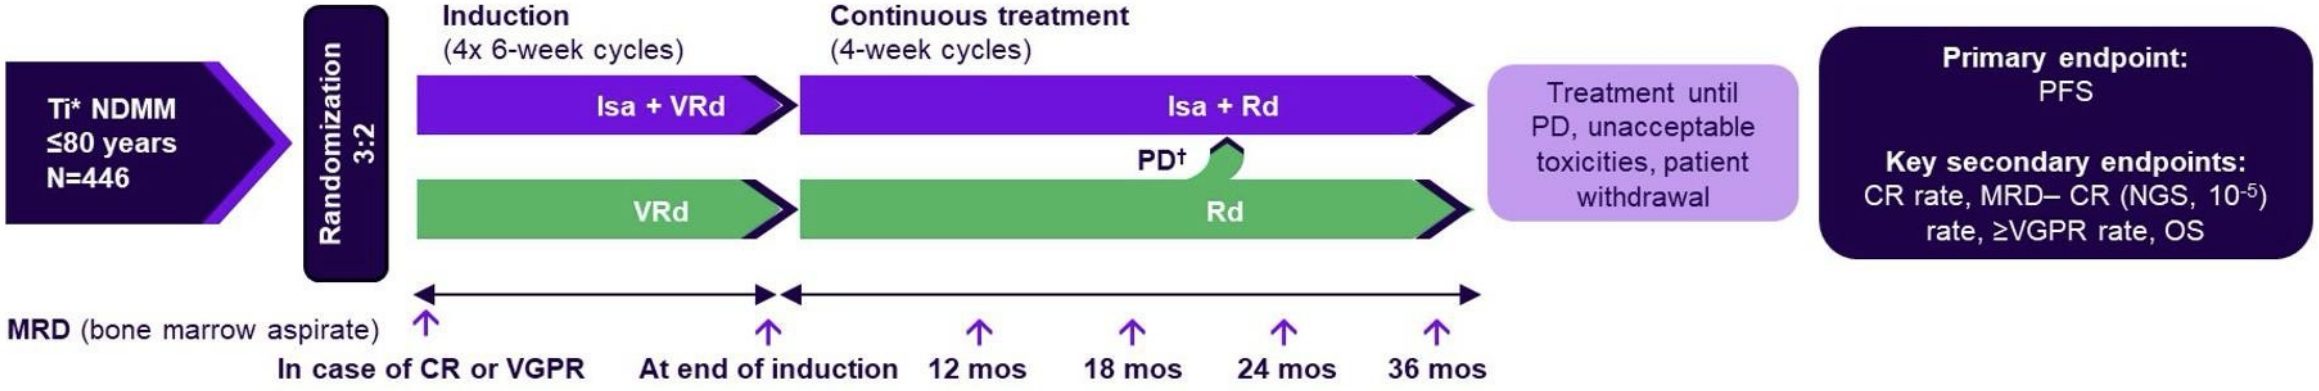
PERSEUS: Improved rates of MRD negativity with the addition of transplant

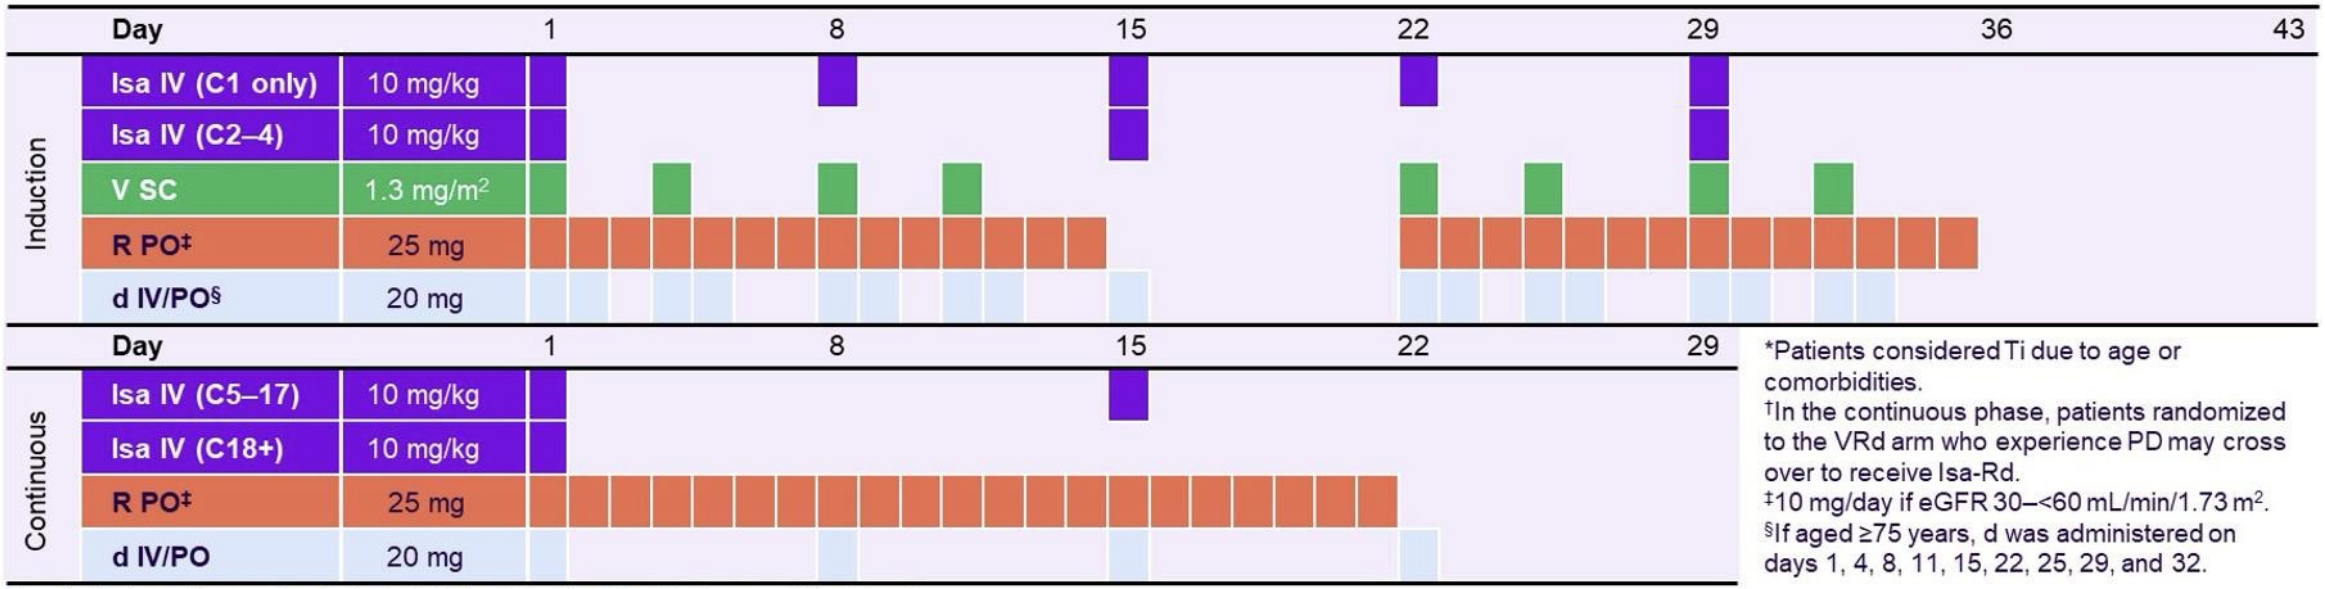


- D-VRd + D-R doubled the rates of deeper MRD negativity at 10^{-6} versus VRd + R
- MRD negativity at 10^{-6} increased by approximately 30% during maintenance with D-R

Rodriguez-Otero ASCO 2024 Abstract 7502

2025: Great options without transplant!
IMROZ: Isatuximab + VRd in Transplant Ineligible NDMM





*Patients considered Ti due to age or comorbidities.
†In the continuous phase, patients randomized to the VRd arm who experience PD may cross over to receive Isa-Rd.
‡10 mg/day if eGFR 30–<60 mL/min/1.73 m^2.
§If aged ≥75 years, d was administered on days 1, 4, 8, 11, 15, 22, 25, 29, and 32.

C, cycle; d, dexamethasone; Isa, isatuximab; R, lenalidomide; SC, subcutaneous; V, bortezomib.

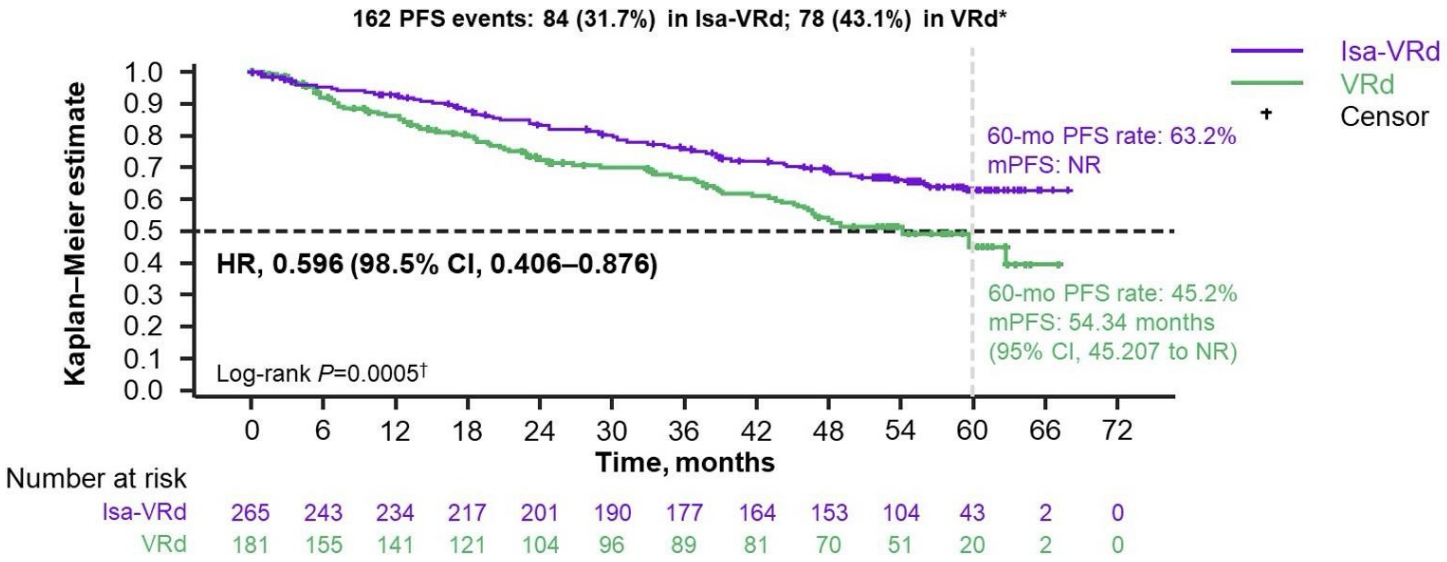
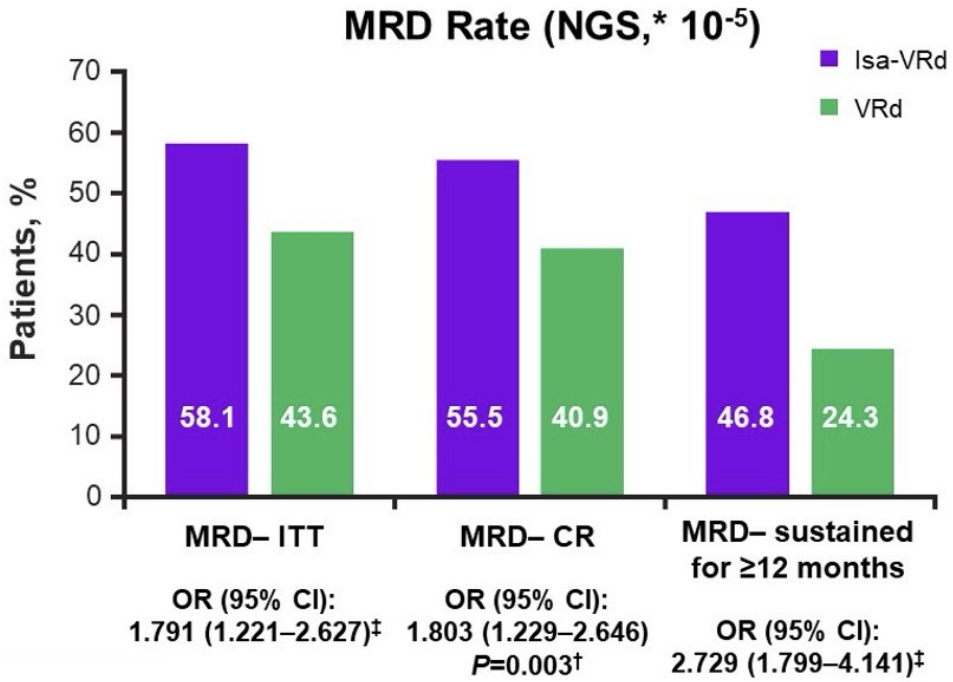
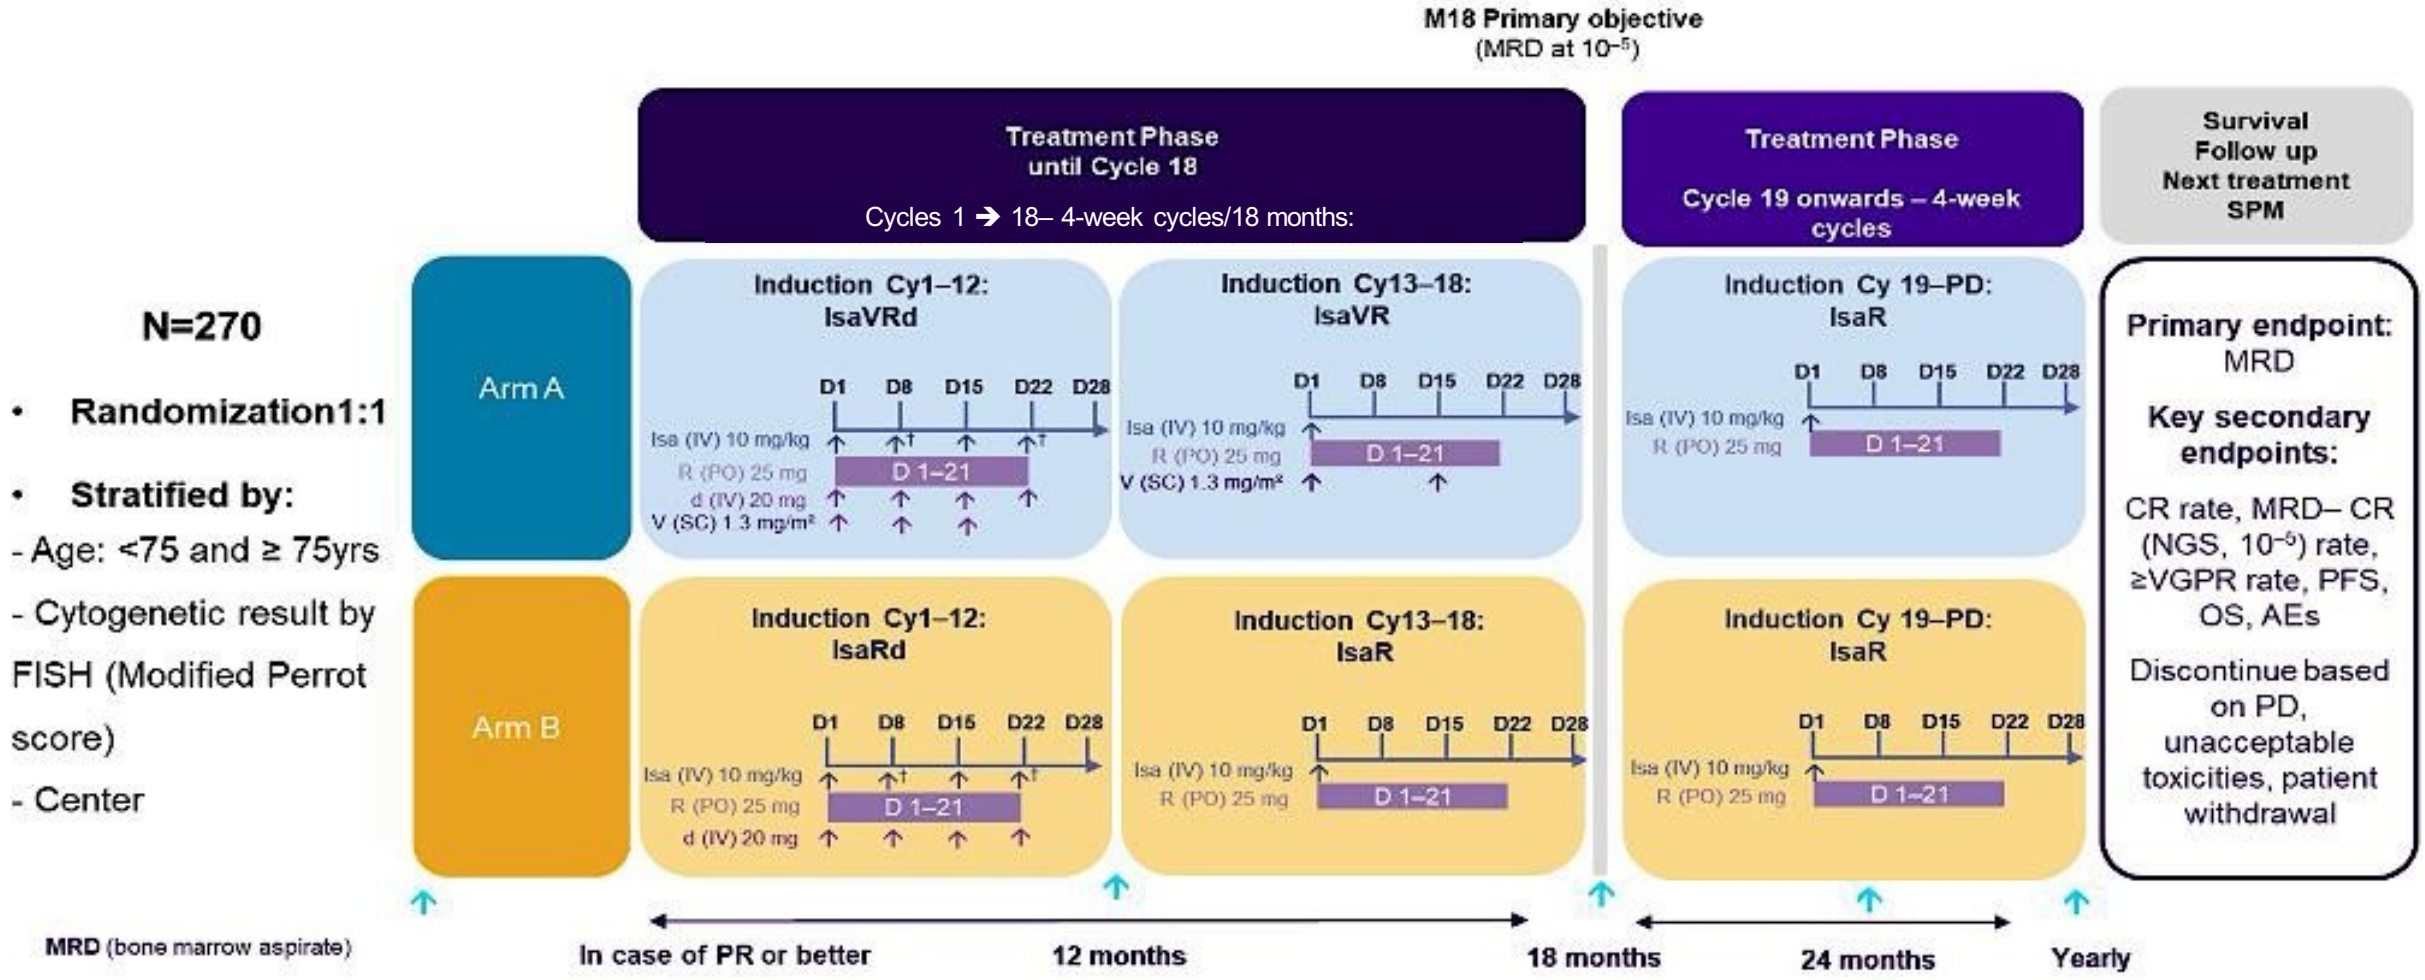
IMROZ: PFS and MRD Negativity Rate that rivals transplant





Facon. ASCO 2024. Abstr 7500. Facon. NEJM. 2024;391:1597.

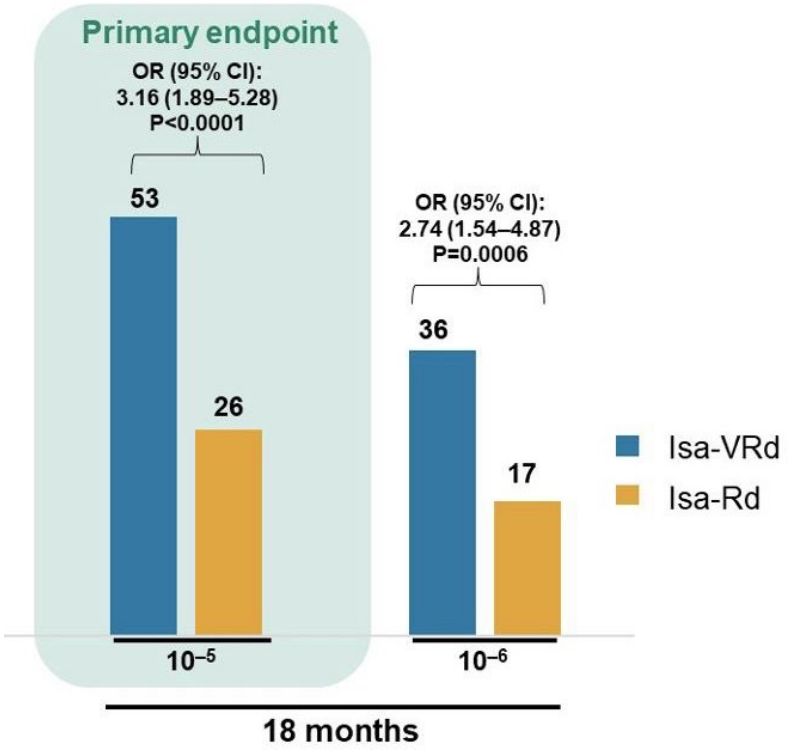
BENEFIT Study Design: Isa-VRd vs Isa-Rd in TI NDMM



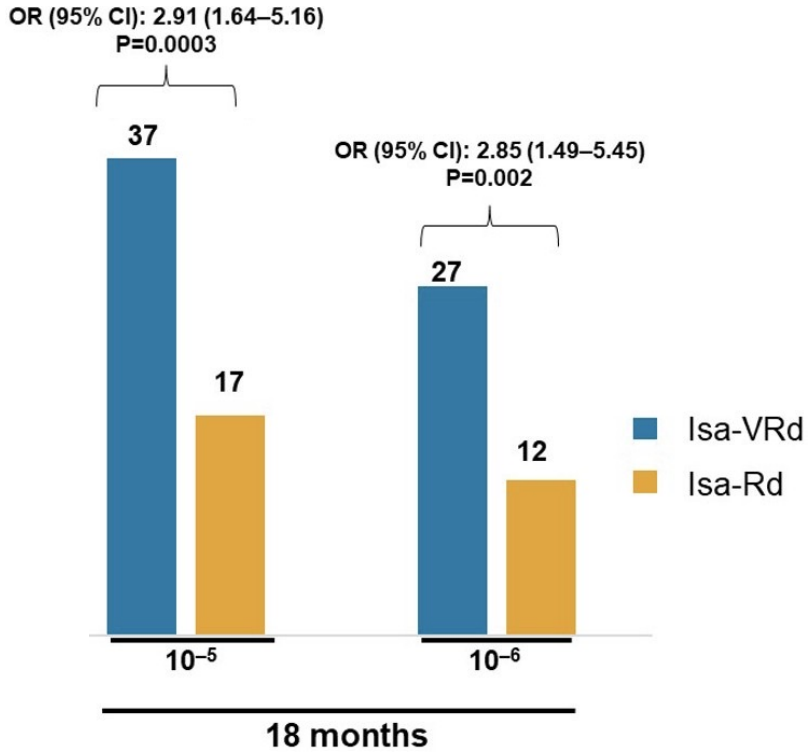
Leleu X et al. ASCO 2024, Abstr 7501.

BENEFIT Trial: Isa-VRd vs. Isa-RD in TI NDMM

Results: **Primary Endpoint MRD(-)**



Secondary Endpoint MRD(-) CR rates



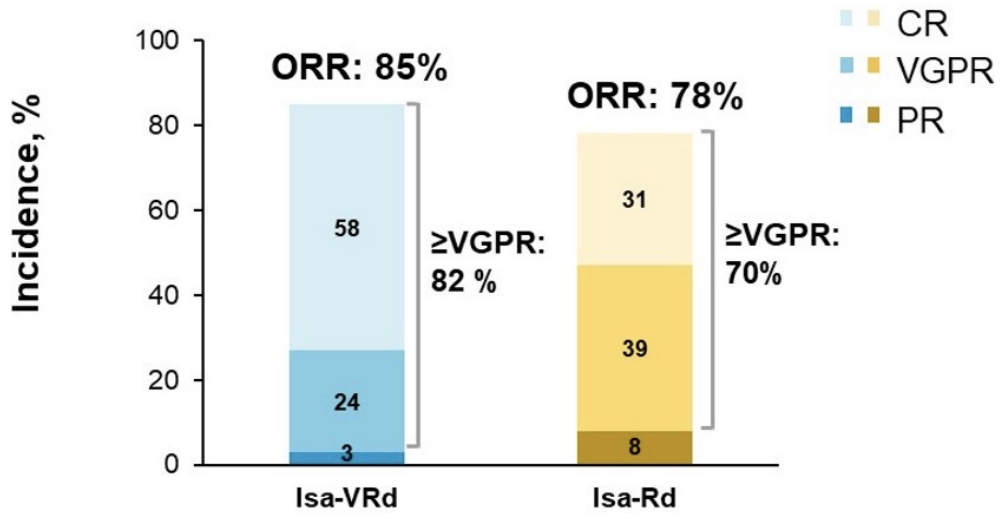
Isa-VRd resulted in significant improvements in MRD- and MRD- CR rates at 18 months and at the 10^{-5} and 10^{-6} levels

*MRD was assessed on the basis of IMWG recommendations.[1]
CI, confidence interval; CR, complete response; Isa, isatuximab; ITT, intent-to-treat; MRD–, minimal residual disease negativity; NGS, next generation sequencing; OR, odds ratio; R, lenalidomide; V, bortezomib.
1. Kumar S, et al. *Lancet Oncol* 2016;17:e328–e346.

Leleu X et al. ASCO 2024, Abstr 7501.

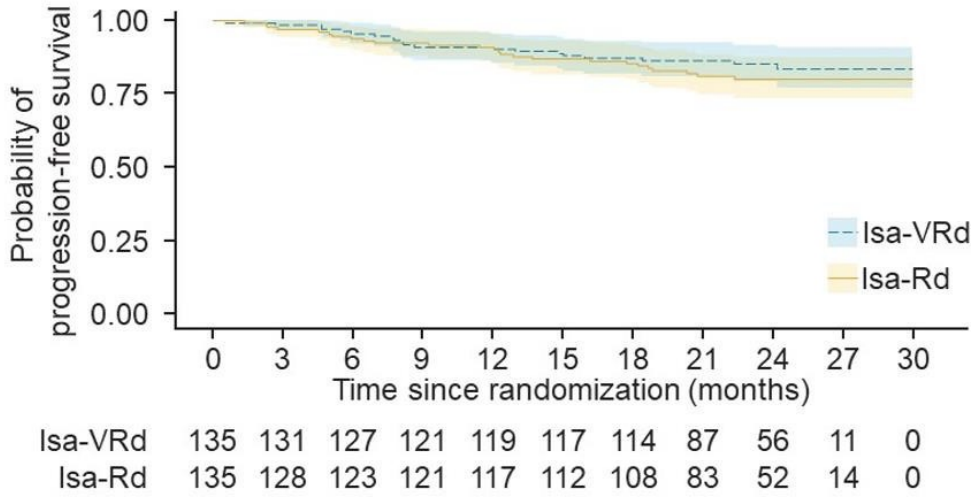
BENEFIT Trial: Isa-VRd vs. Isa-RD in TI NDMM

Results: Depth of Response (at 18 mos)



≥CR rate 58% vs. 31%, OR (95% CI): 2.97 (2–5), p<0.0001

Preliminary PFS (Median F/U 23.5 mos)



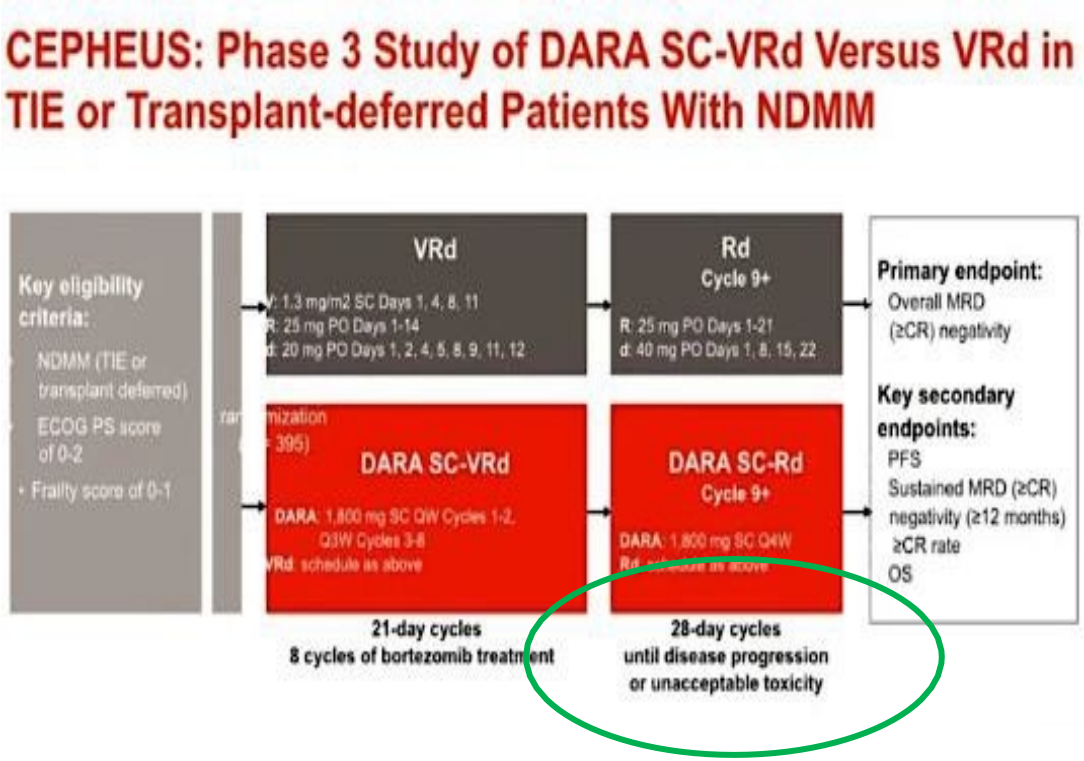
Estimated 24 months PFS
85.2% (95%CI 79.2–91.7) for Isa-VRd
80.0% (95% CI 73.3–87.4) for Isa-Rd

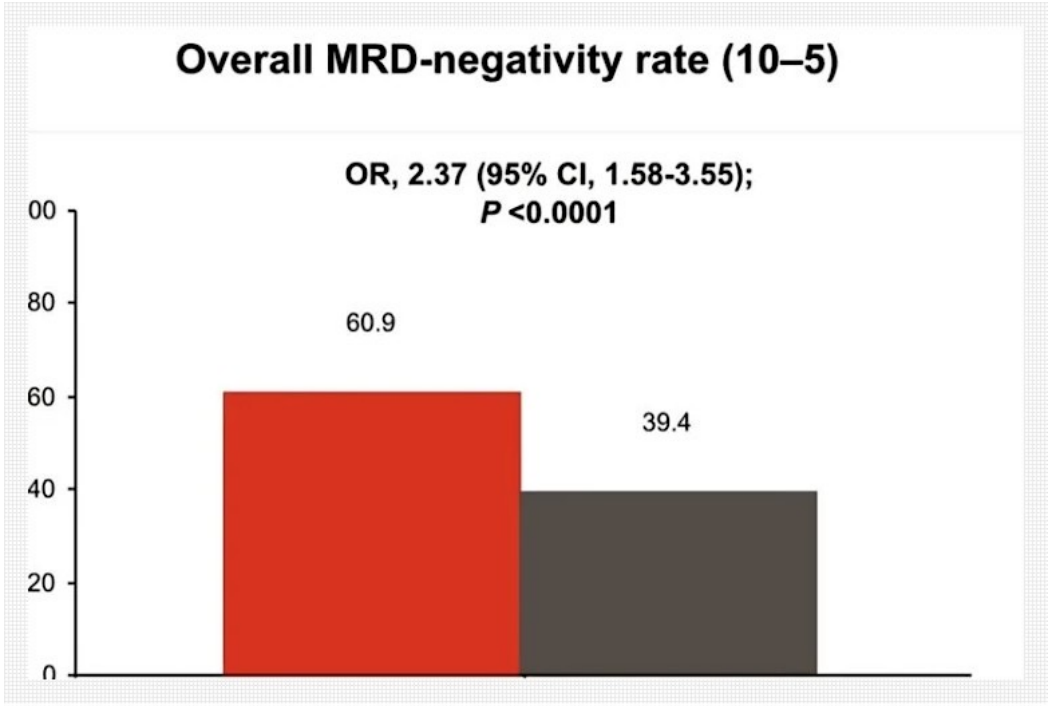
Isa-VRd resulted in deep response rates, particularly CR at 18 months and PFS is still immature

*MRD was assessed on the basis of IMWG recommendations.[1]
CI, confidence interval; CR, complete response; Isa, isatuximab; ITT, intent-to-treat; MRD–, minimal residual disease negativity; NGS, next generation sequencing; OR, odds ratio; R, lenalidomide; V, bortezomib.
1. Kumar S, et al. *Lancet Oncol* 2016;17:e328–e346.

Leleu X et al. ASCO 2024, Abstr 7501.

Impressive results in recent CEPHEUS trial without transplant





This trial was done in the middle of COVID. There were more COVID related deaths in quad arm. But OS attend favors Dara VRd.

Usmani S IMS 2024, Usmani Nat Med 2025

Is anti CD 38 needed in both induction and maintenance?

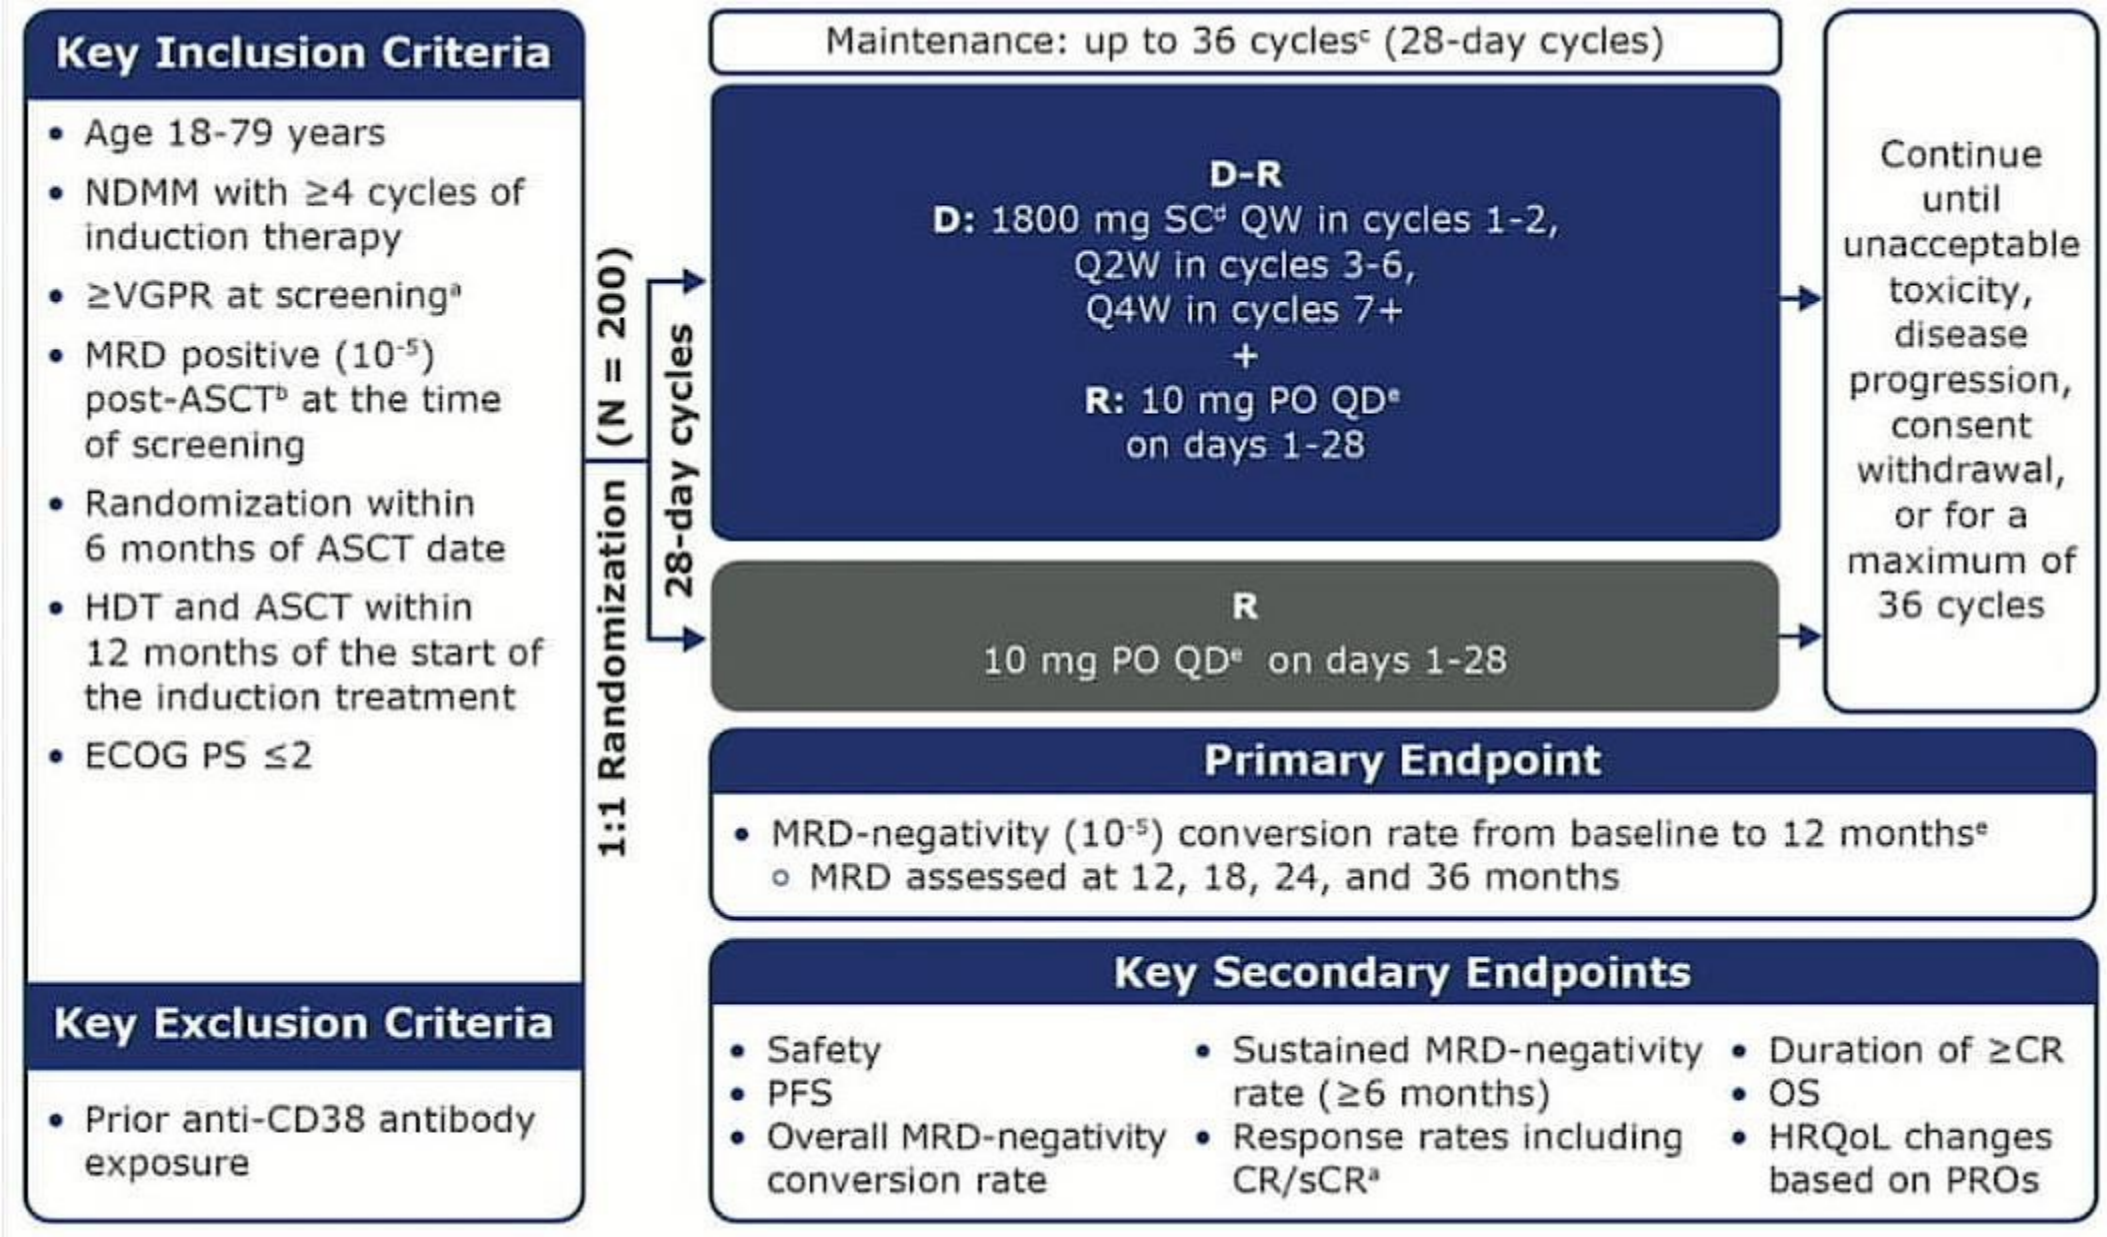
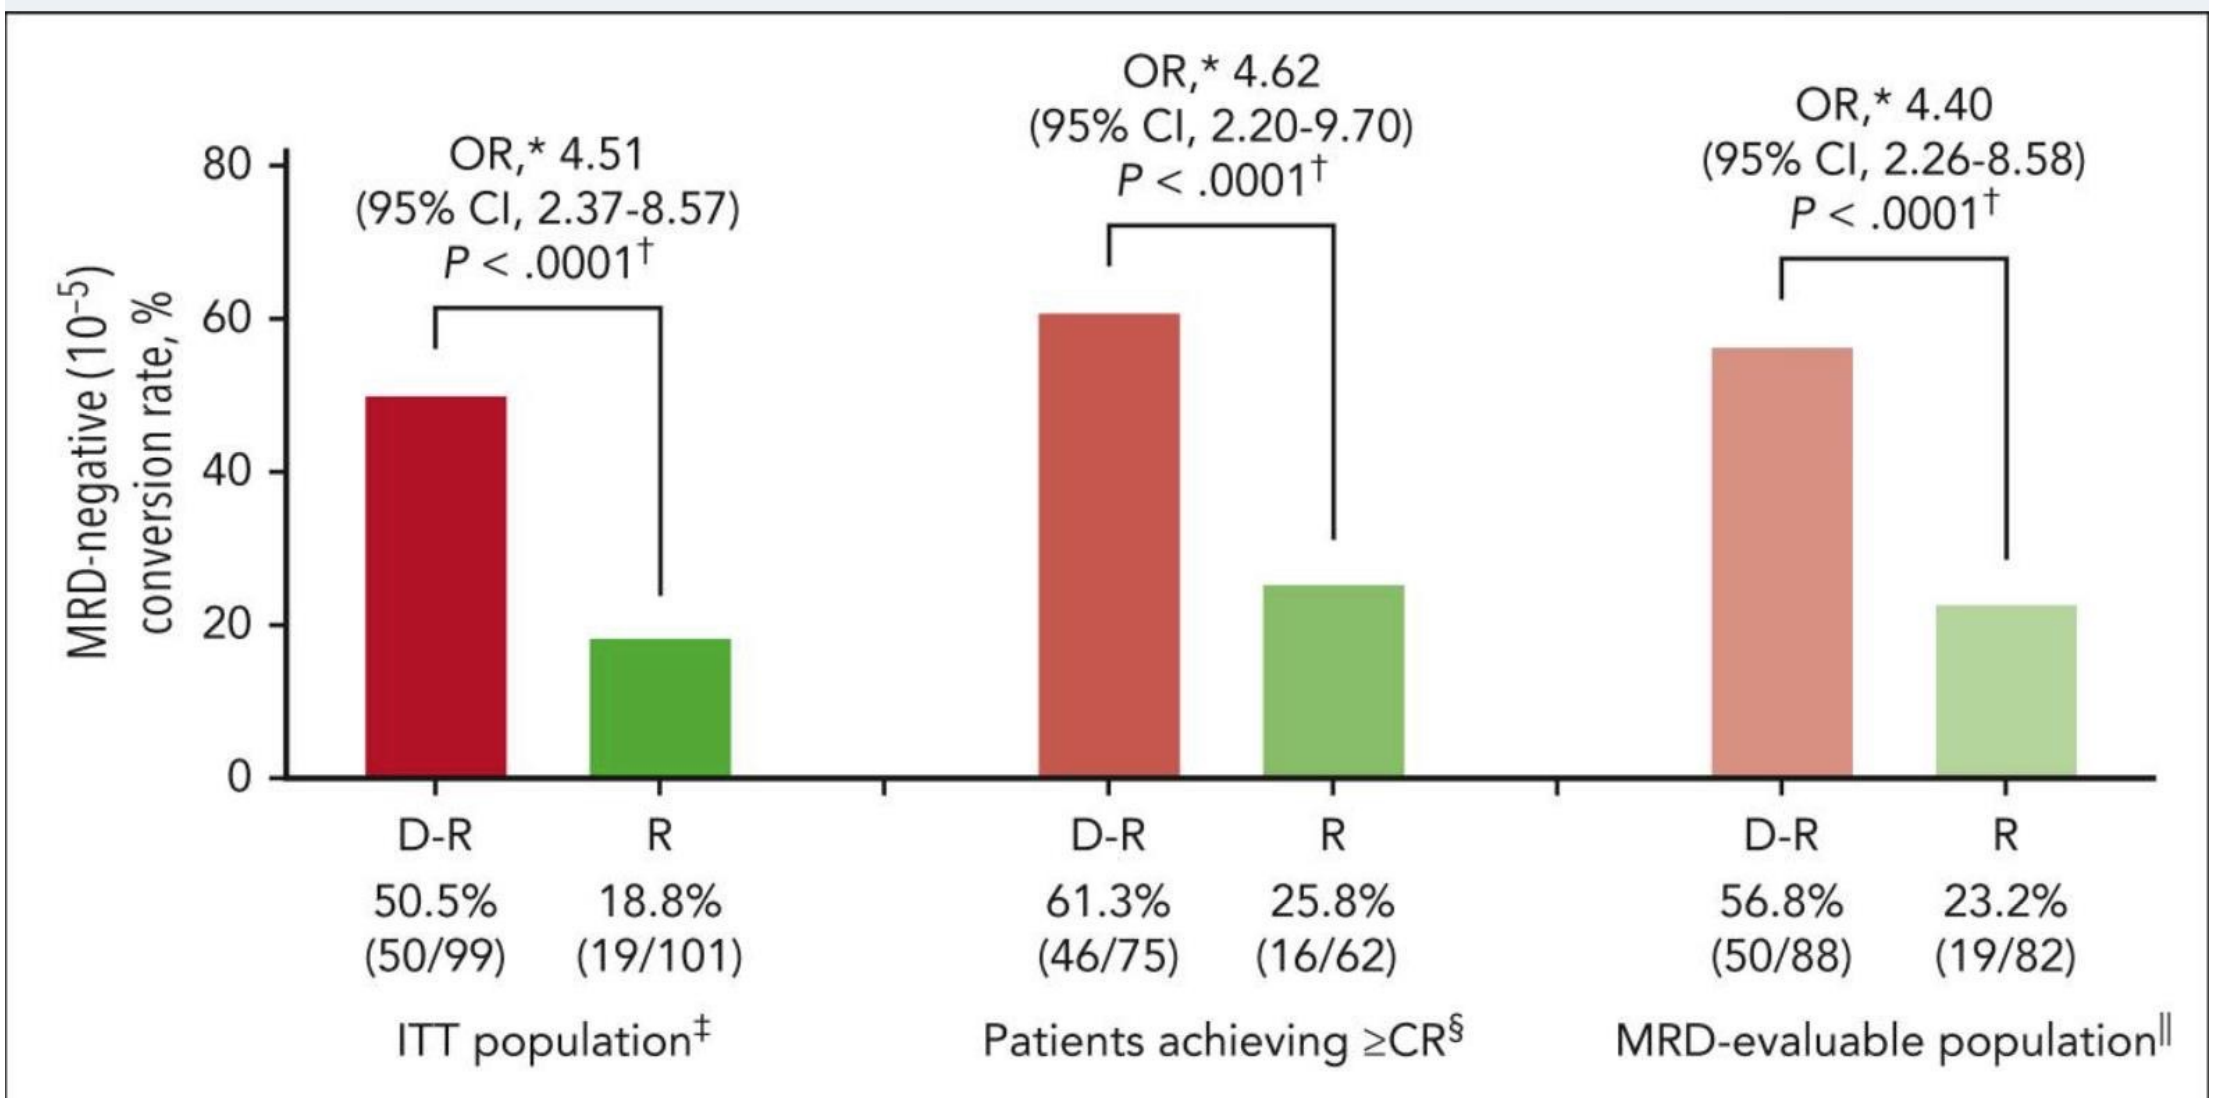
AURIGA Trial

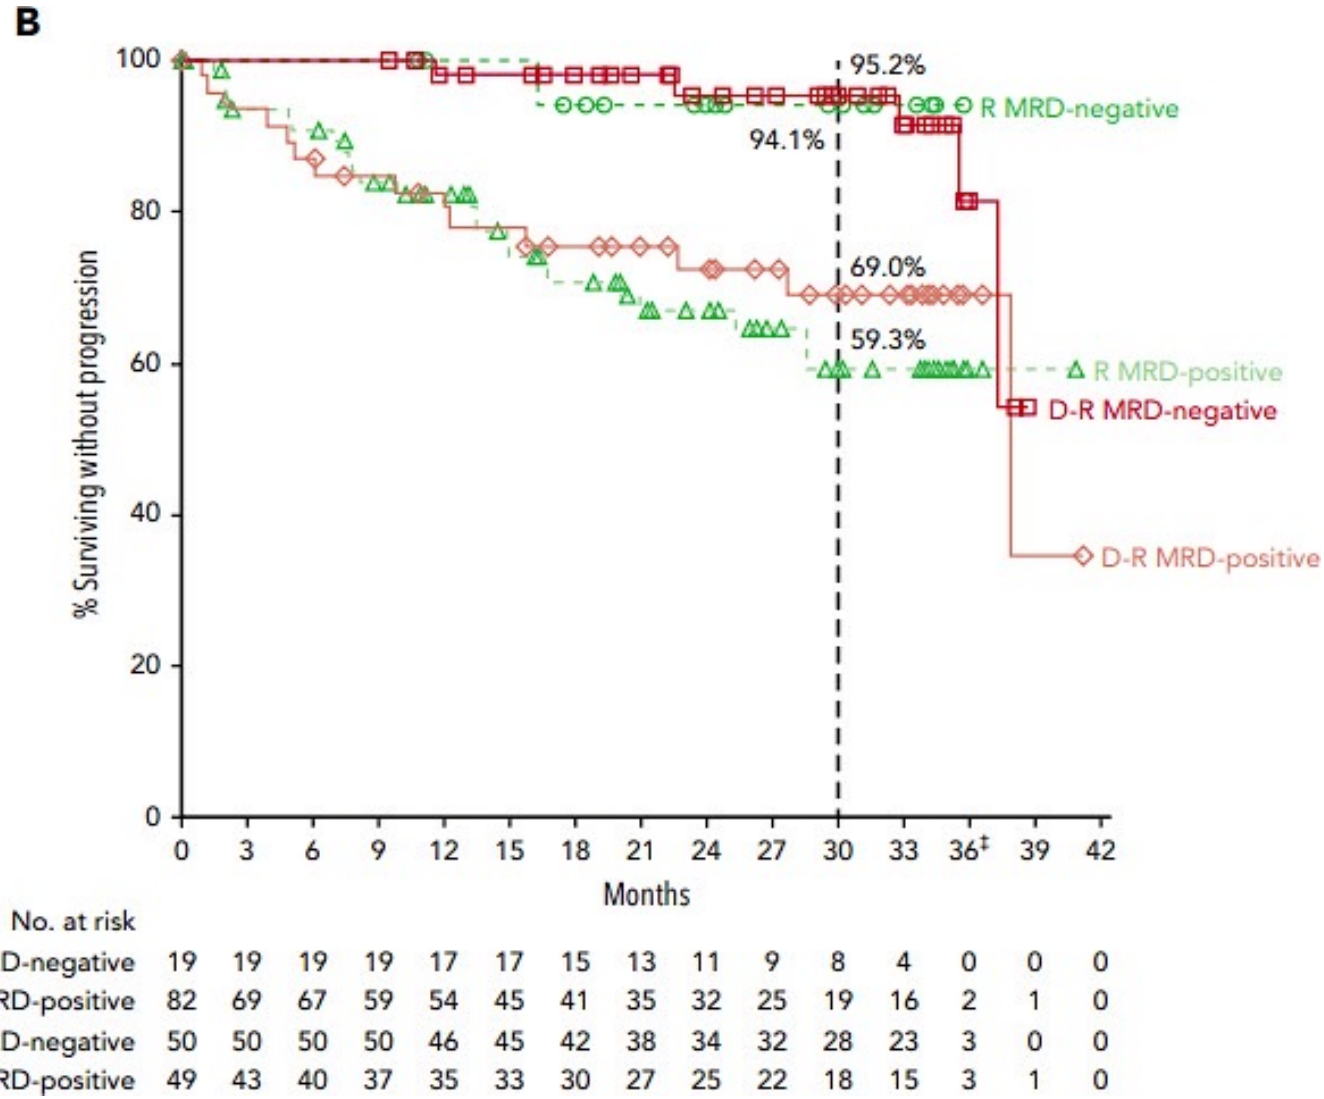


Badros A Blood 2024 145:300



Badros A Blood 2024 145:300

- Narrow eligibility requirements (no previous anti CD 38, MRD positive)
- Addition of daratumumab increases incidence of infections, mostly URIs
- Increases incidence of hypogammaglobulinemia

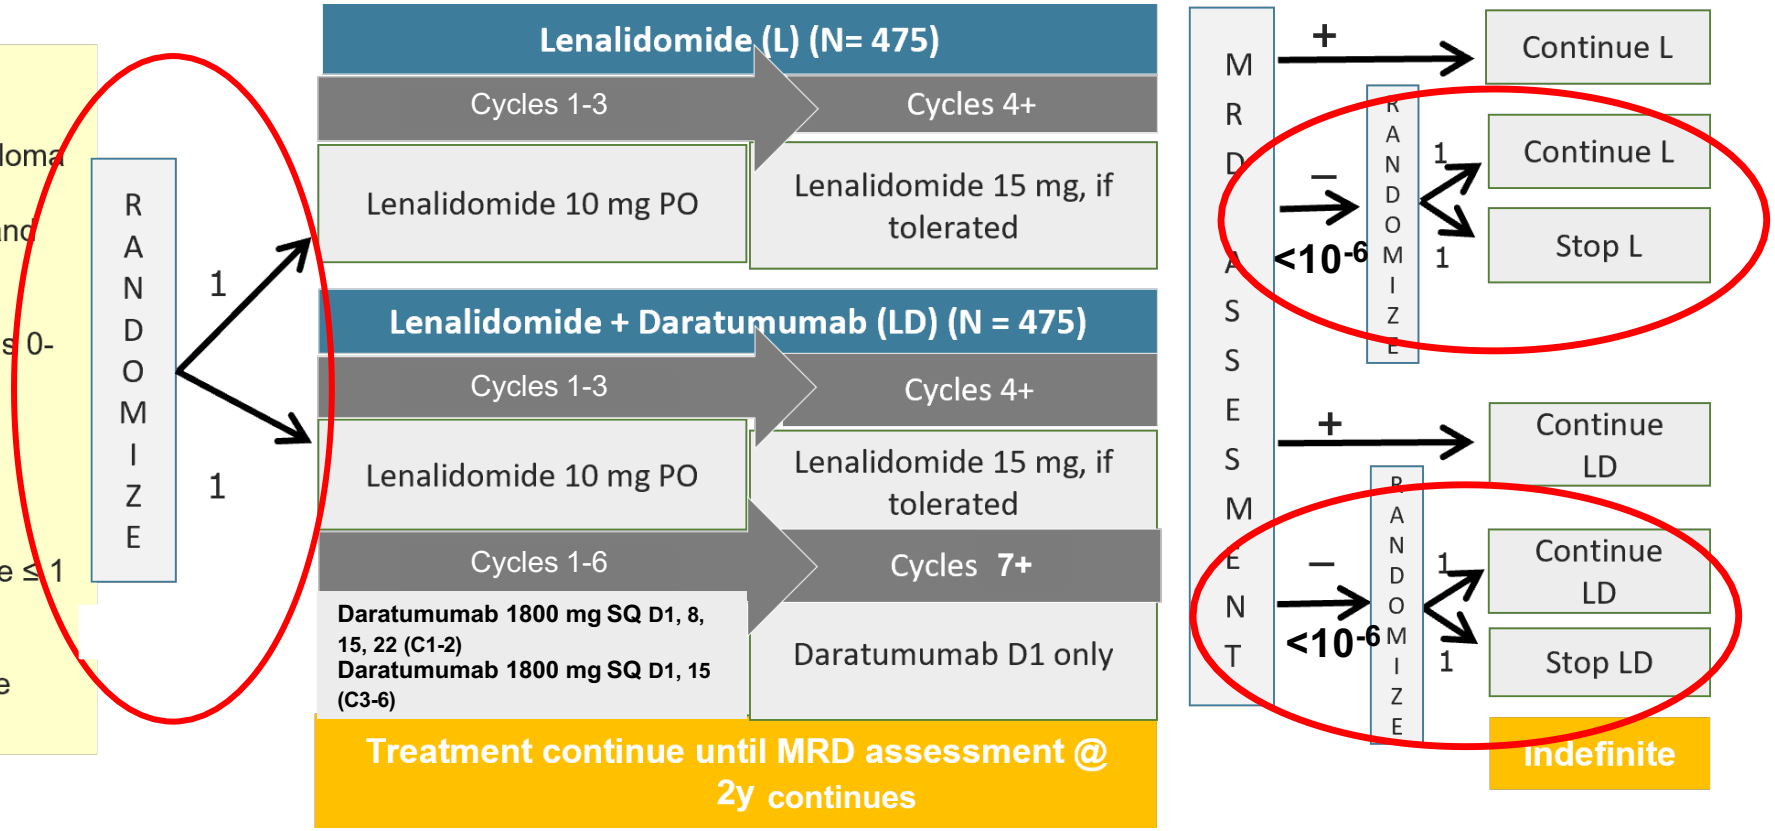


Badros A Blood 2024 145:300

DRAMMATIC Trial Schema (SWOG 1803)

Key eligibility

- First Registration: Study-Entry
  - Symptomatic multiple myeloma requiring systemic therapy prior to induction therapy and ASCT
  - Age 18-75
  - Zubrod Performance Status 0-2
- Second Registration: Eligibility
  - Lenalidomide REMS requirements
  - Lab normalization
  - ASCT related toxicity grade ≤ 1
- Third Registration: Second Randomization
  - Received 2 yr maintenance
  - MRD results



- Registration Step 1: *baseline specimen for ID (B-cell clonality) mandatory
- Registration Step 2: within 180 days after ASCT (***1st randomization***)
- Registration Step 3: completed 24 months of maintenance and MRD-neg + ≥VGPR (*<10^{-6}) (***2nd randomization***)

DRAMMATIC: Objectives

- **Primary objective**: Overall survival (OS) from 1st randomization:
  lenalidomide + daratumumab/rHuPH20 vs. lenalidomide

- **Secondary objectives** include traditional efficacy outcomes, including MRD-neg rate between the treatment arms.
  - OS of MRD-neg (+≥VGPR) pts who continue maintenance on each arm vs. those who discontinue (**objective of 2nd randomization**)
  - **24-month MRD analysis**
  - Patient-reported health-related quality of life (PROs: HR-QoL) **(n=250)**

Long term follow up for IKEMA (IKd): mPFS 35.7mo; responses in +1q

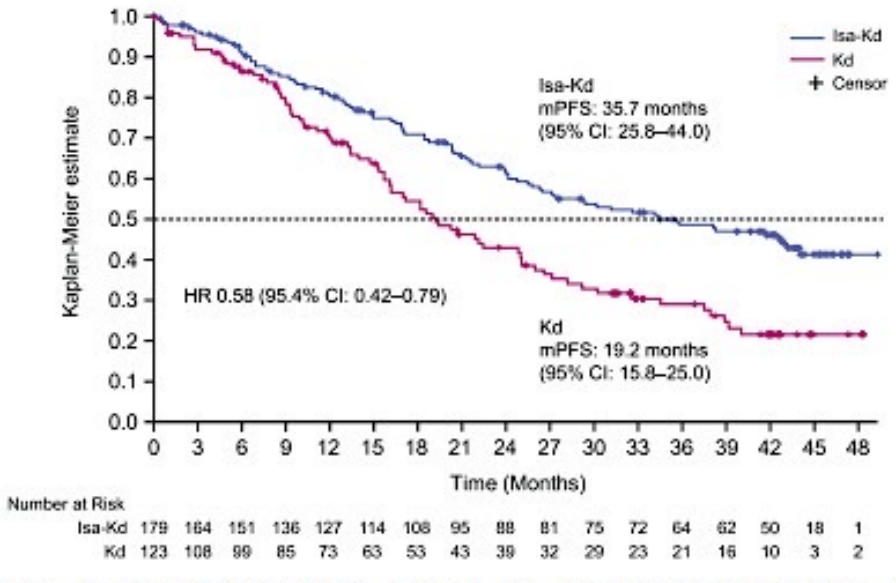


Fig. 2 Updated PFS with Isa-Kd vs Kd (ITT population). CI confidence interval, d dexamethasone, HR hazard ratio, Isa isatuximab, ITT intent to treat, K carfilzomib, mPFS median progression-free survival.

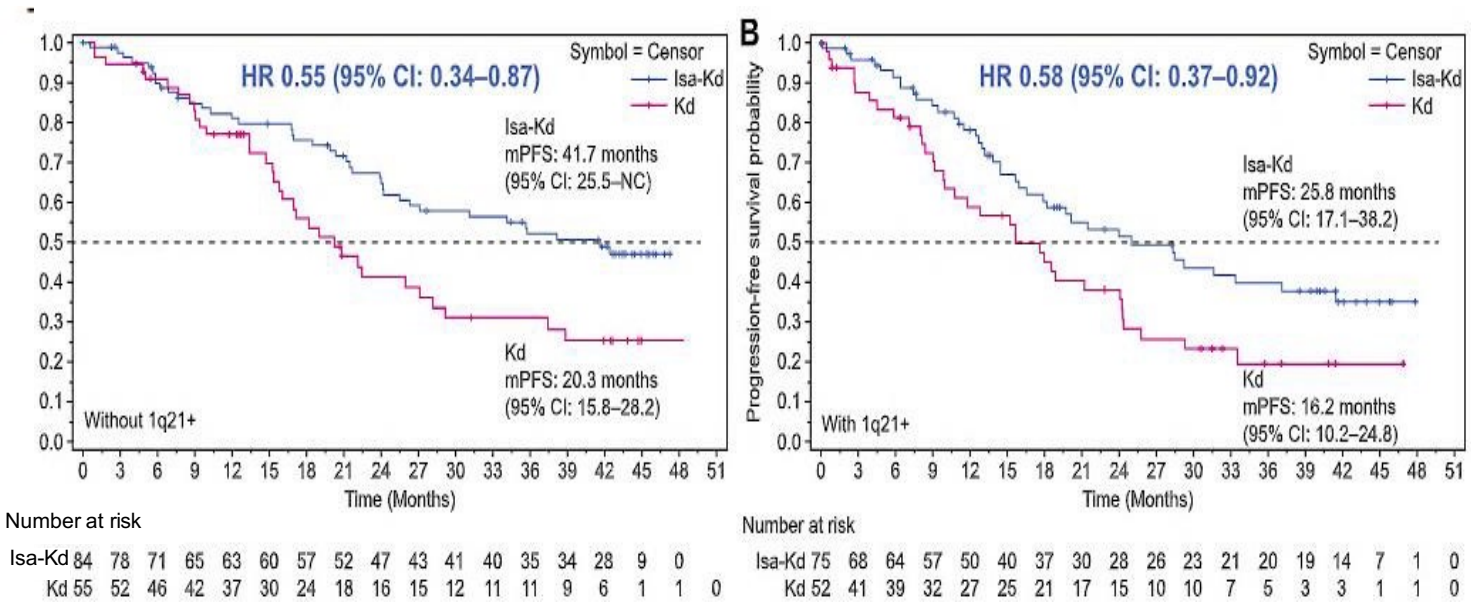
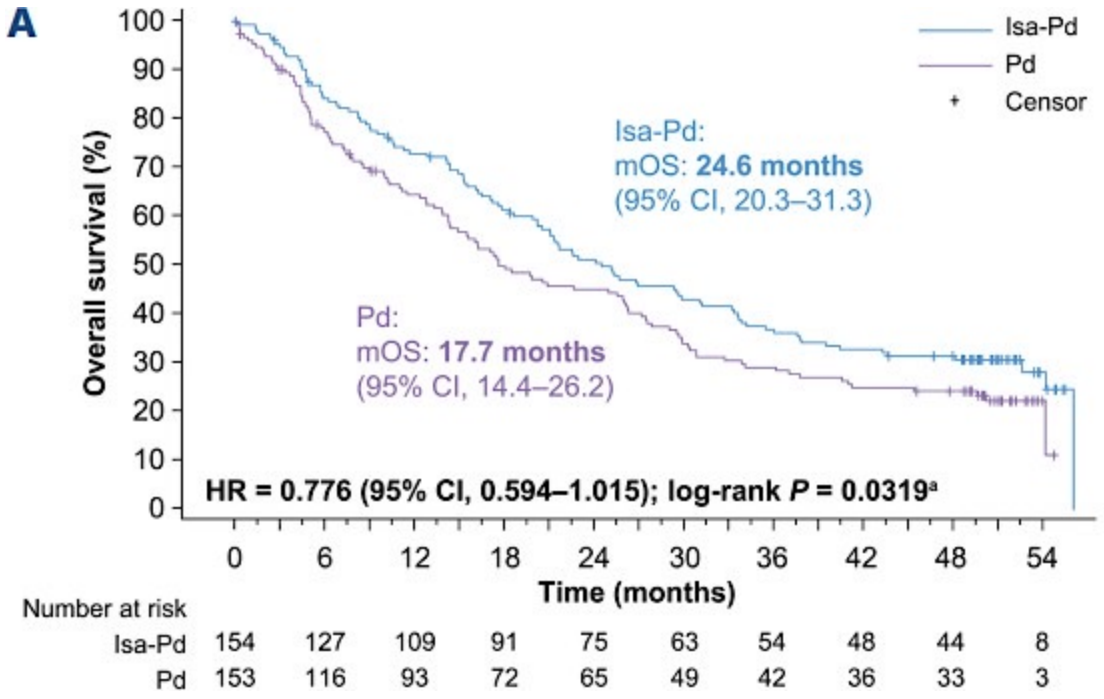
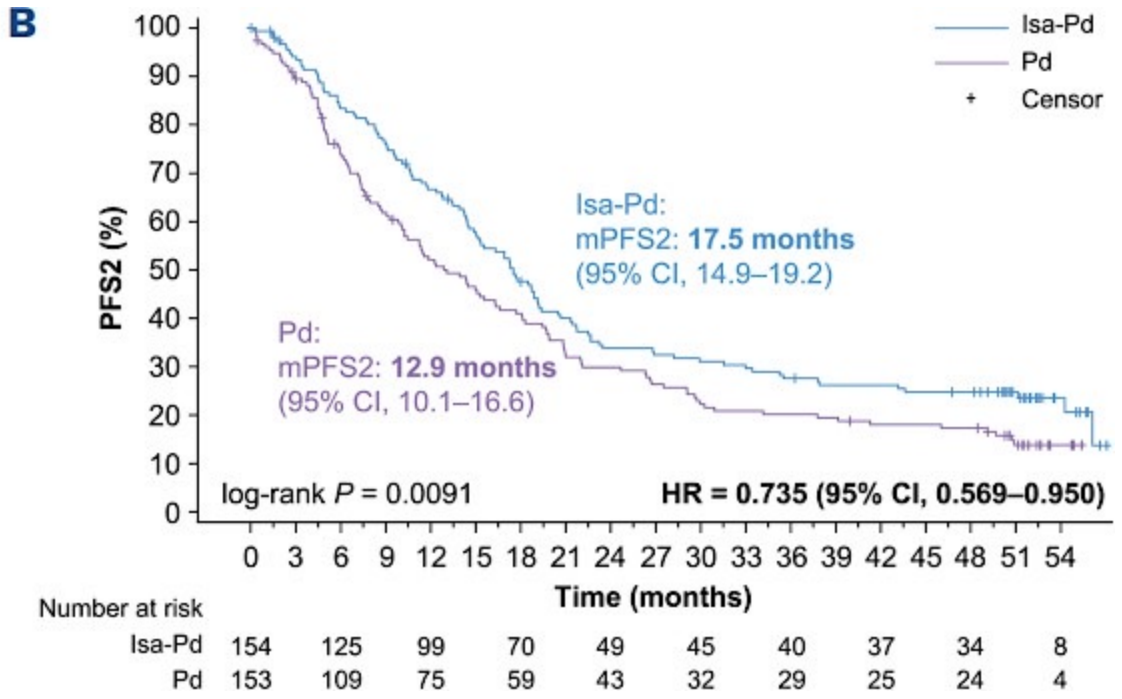


Martin T Blood Cancer Journal (2023) 13:72; Facon T Hematol Oncol 2024 42:e4258

Long term follow up of ICARIA (isa/pom/dex): superior overall survival and PFS2





Richardson P 2024 Haematologica 109:2239

Isatuximab Subcutaneous Formulation Met Co-Primary Endpoints in the IRAKLIA Phase III Study in MM

Press Release: January 9, 2025

"Results from the investigational, randomized, open-label IRAKLIA phase 3 study demonstrated that isatuximab administered at a fixed dose subcutaneously (SC) via an on-body delivery system in combination with pomalidomide and dexamethasone (Pd) met its co-primary endpoints of non-inferior objective response rate (ORR) and observed concentration before dosing (C trough) at steady state compared to intravenous (IV) isatuximab administered at a weight-based dose in combination with Pd in patients with relapsed or refractory multiple myeloma.

Key secondary endpoints, including very good partial response, incidence rate of infusion reactions and C trough at cycle 2 were also achieved. The study is ongoing, and the full results will be presented at a forthcoming medical meeting."

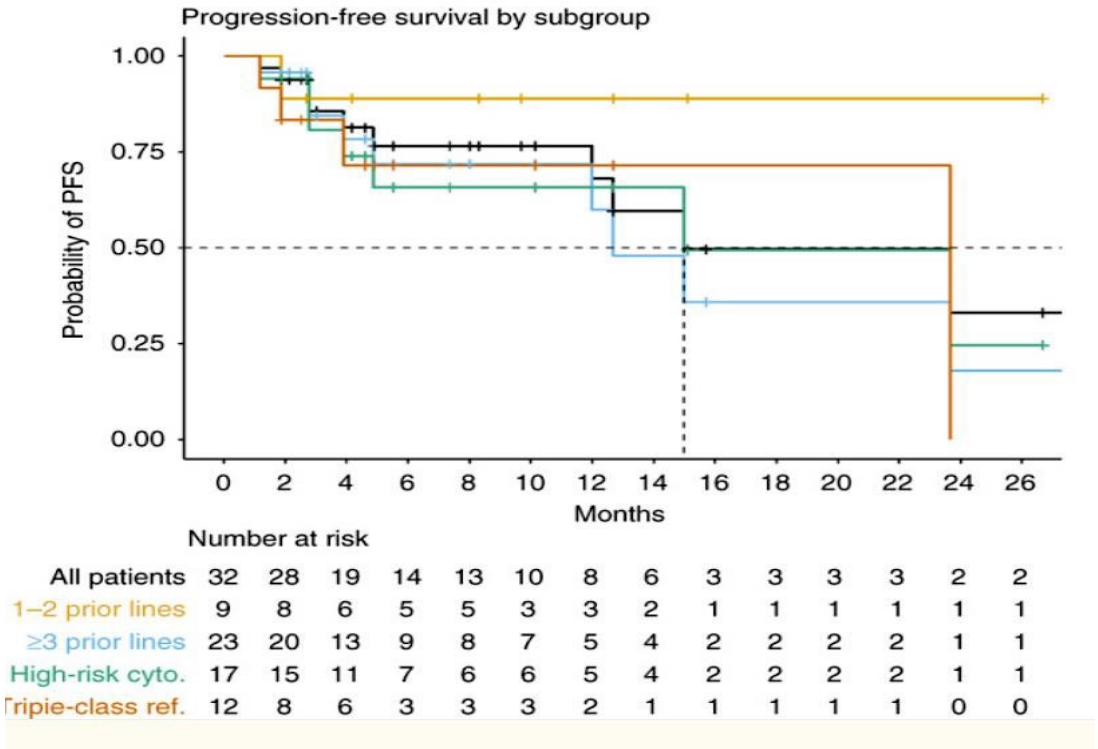
RTP RESEARCH TO PRACTICE

Selinexor in combination with IMID or PI showing good activity in RRMM: key is lower doses

Once weekly selinexor, carfilzomib and dexamethasone in carfilzomib non-refractory multiple myeloma patients



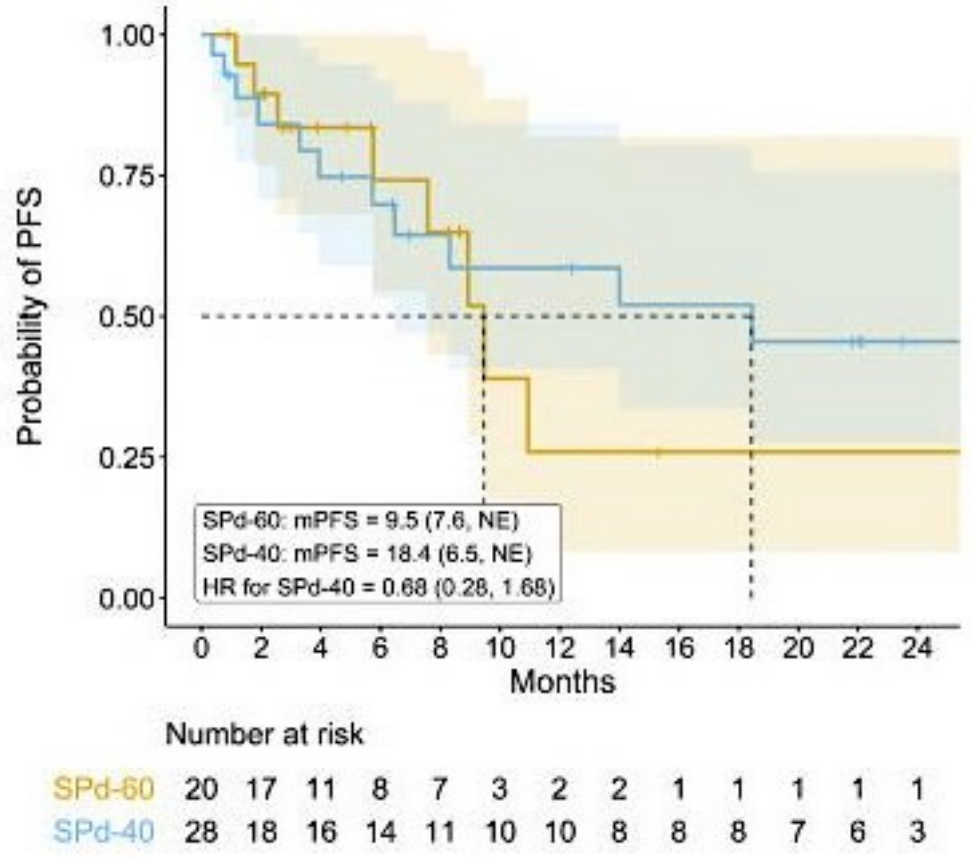


FIGURE 1
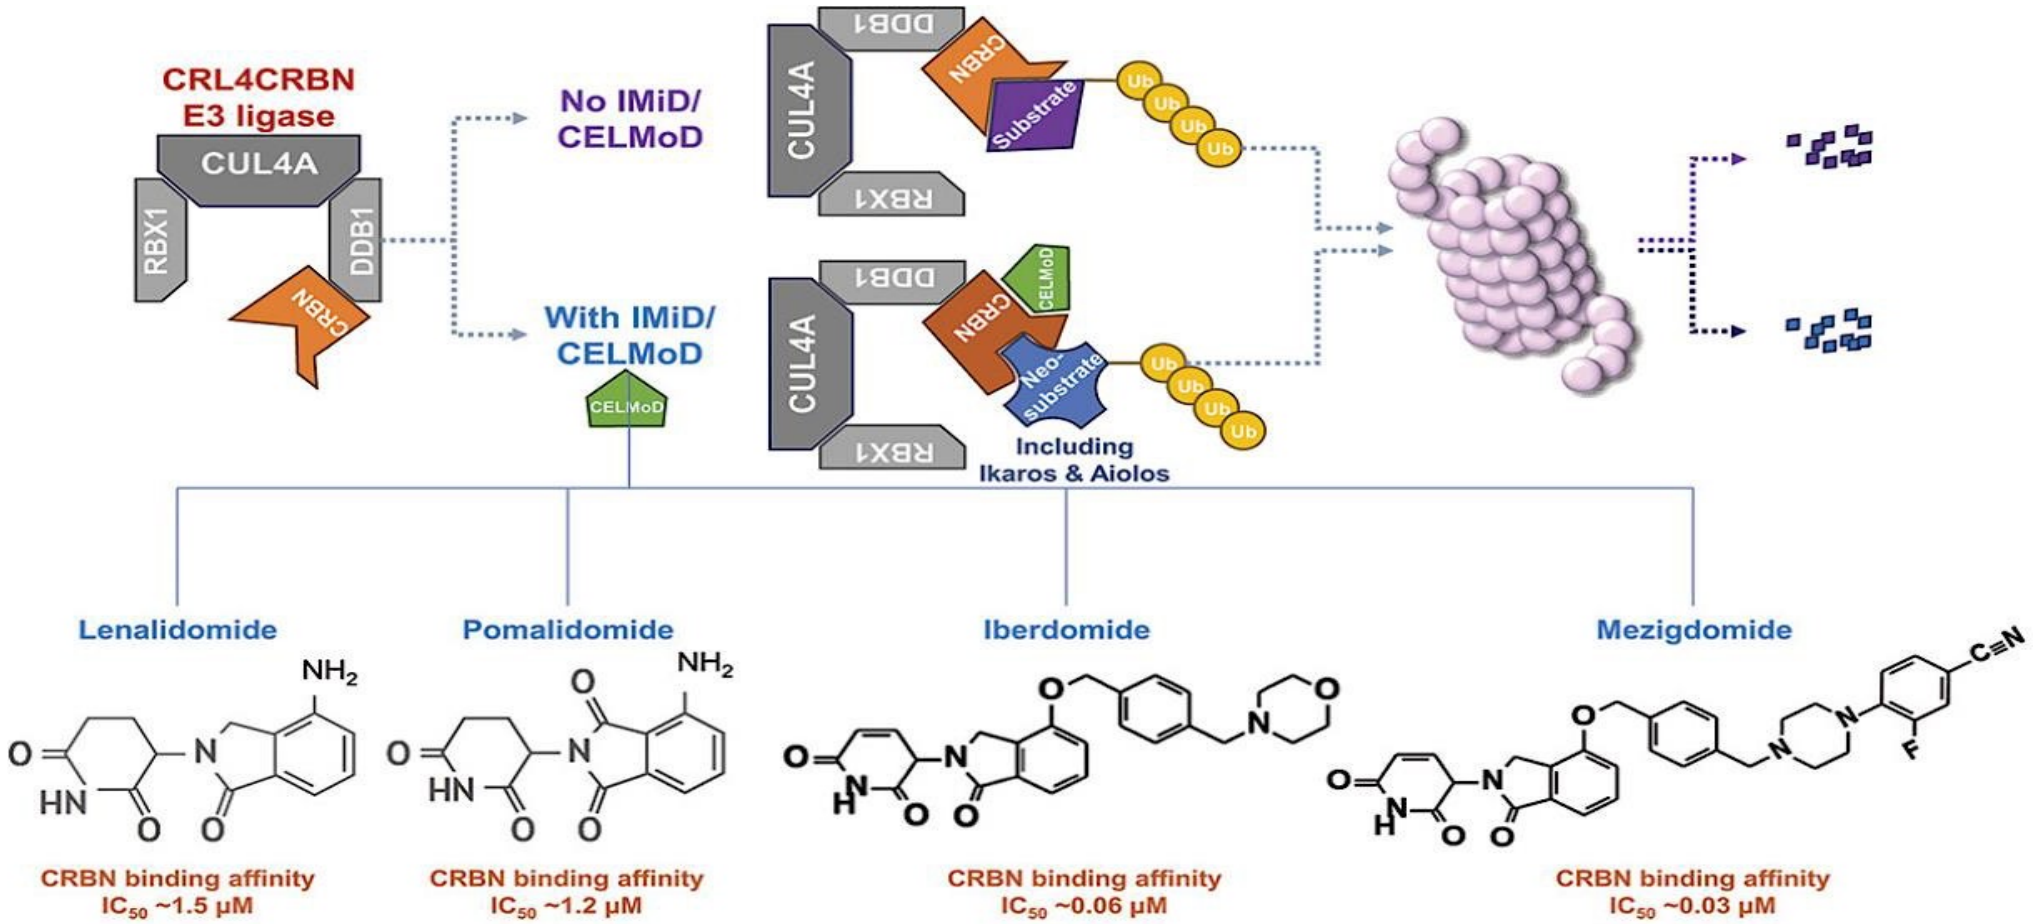
Kaplan-Meier curve comparing progression-free survival in patients who received SPd-40 versus those who received SPd-60.

Gasparetto Br J Cancer 2022;126:718; White D Front. Oncol. 14:1352281. 2024

CELMoDs: bind with higher affinity to cereblon



Liu Y Exp Rev Hematol 2024 https://doi.org/10.1080/17474086.2024.2382897

1025 Mezigdomide (MEZI) Plus Dexamethasone (DEX) and Bortezomib (BORT) or Carfilzomib (CFZ) in Patients (pts) with Relapsed/Refractory Multiple Myeloma (RRMM): Updated Results from the CC-92480-MM-002 Trial

- RRMM, median lines 3(2-4)
- Median age 65.5
- Refractory to IMID 85.7-88.9%
- Refractory to PIs 50.0% to 51.7%

Gr ¾ AEs: thrombocytopenia 26.5%, neutropenia 63.3%, infections 32.7%

- Cohort A: 0.3, 0.6 or 1 mg mezi with Bort/Dex n=28
- Cohort C: Mezi/Carf/Dex n=27
- Cohort D: Mezi/VD dose expansion n=49 with either 0.6 or 1 mg Mezi

ORR A: 75%, VGPR 39.3%

ORR C: 85.2%, VGPR 44.4%

Addition of Mezi seems to re sensitize refractory pts

Sandhu I et al. ASH 2024

Discussion Questions

- Regulatory and reimbursement issues aside, what is your preferred initial regimen for an older (78-year-old), otherwise healthy patient with standard-risk MM who is not eligible for transplant?

- In general, when incorporating an anti-CD38 antibody into first-line treatment for patients with newly diagnosed MM, which agent do you prefer? How, if at all, does age and transplant-eligibility impact your choice? Do you generally partner with a doublet or triplet regimen? What is your preferred regimen to partner an anti-CD38 antibody with?

Discussion Questions

- In general, to which patients, if any, with relapsed/refractory MM do you currently administer selinexor? What are your preferred agents to partner it with? What is your usual starting dose of selinexor? Does that dose vary depending on the agents it is being combined with?

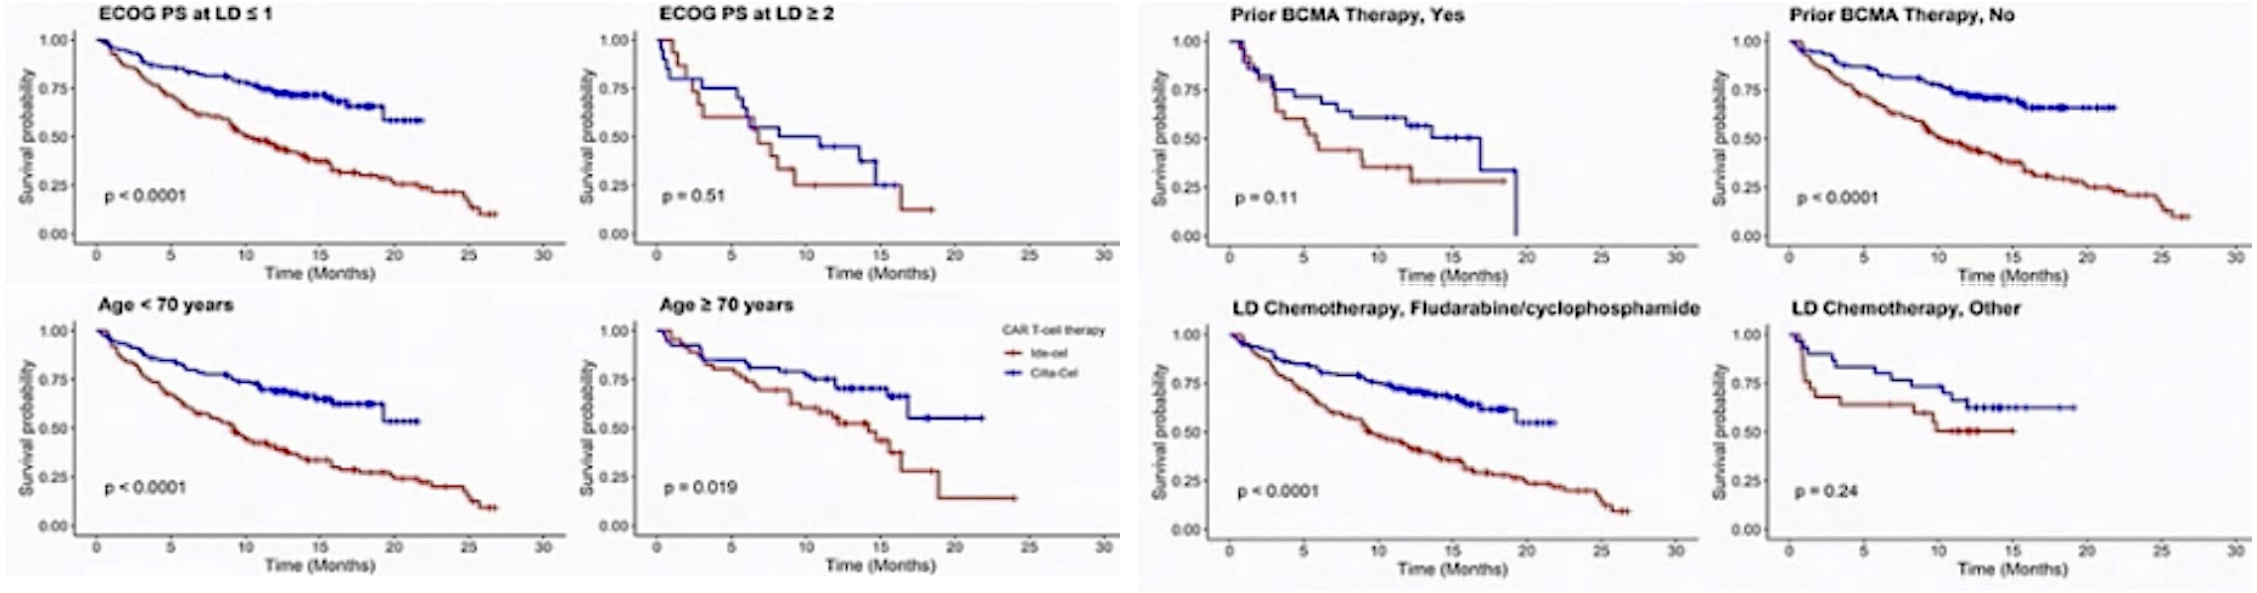
Multicenter Retrospective Analysis of Ide-Cel and Cilta-Cel for Patients With RRMM: *PFS Across Subgroups (cont'd) and Summary*

PFS by Patient and Treatment Characteristics



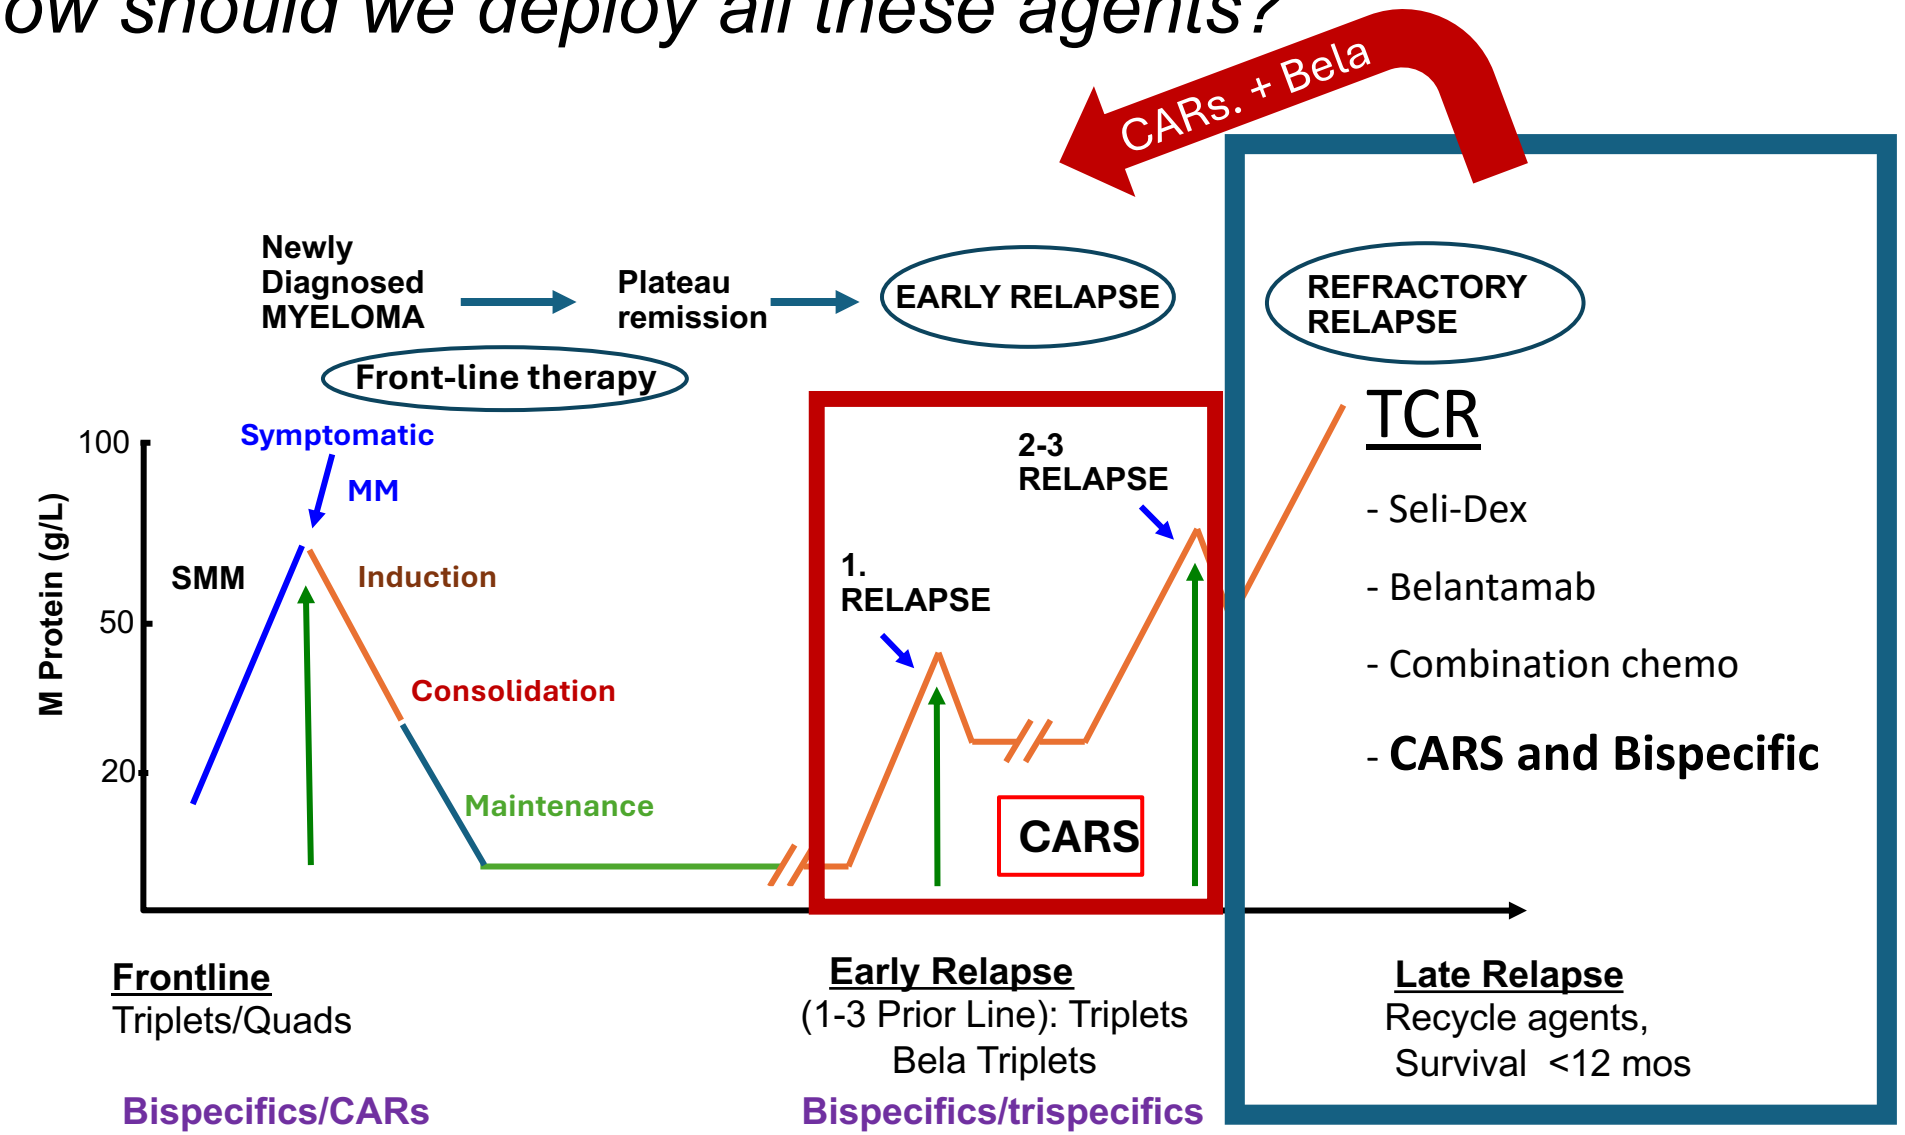
Authors' Conclusions

- This analysis of Cilta-cel vs Ide-cel demonstrated higher efficacy, including responses and survival (overall and by patient subgroups); higher rates of some toxicities (severe CRS, delayed NR, infection); no difference in the rates of other toxicities and NRM
- Results remained consistent in sensitivity analyses, and these results may aid in clinical decision-making, patient counseling, and may help guide CAR T-cell therapy selection; however, the study was limited by being retrospective and due to potential biases in real-world data

Hansen DK, et al. IMS 2024. Abstract OA-07.

Sequencing Therapy in MM:

How should we deploy all these agents?

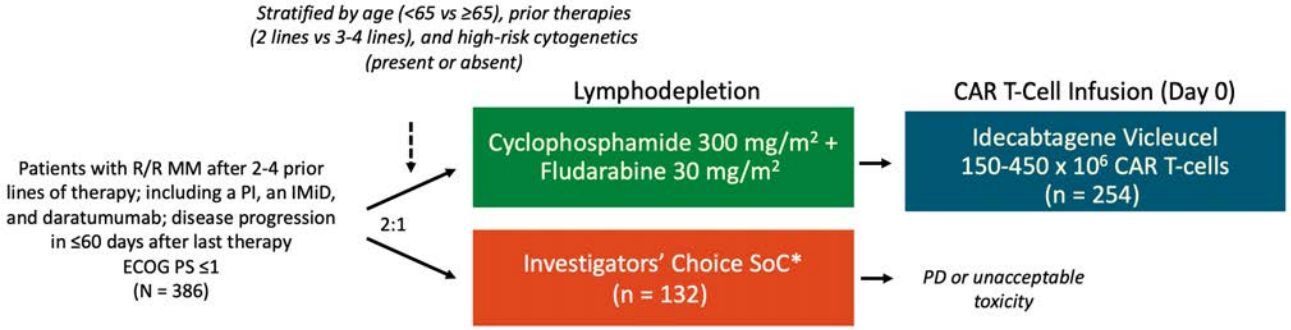


Trials:

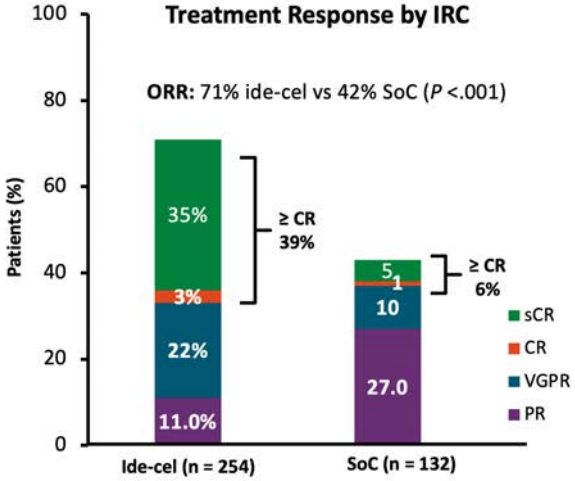
CART in Earlier Lines

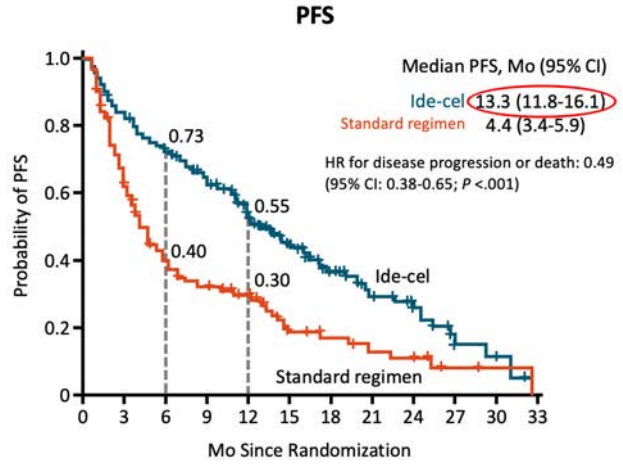
KarMMa-3: Phase III Trial of Ide-Cel vs SoC in R/R MM

- International, open-label, randomized phase III trial

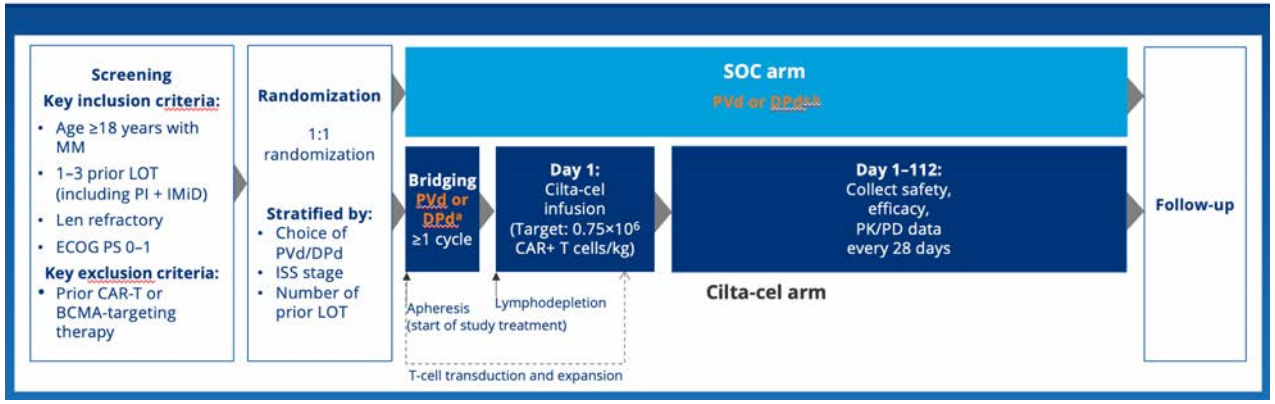


Median 3 PLT (TCR 65%): ORR 71%, PFS 13.3m

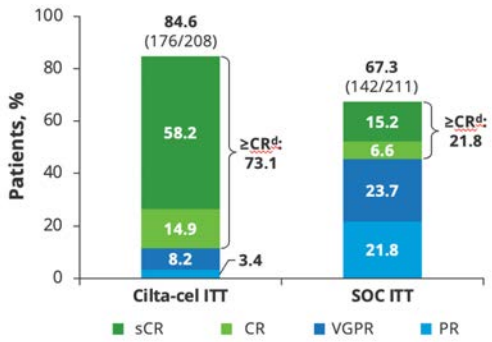


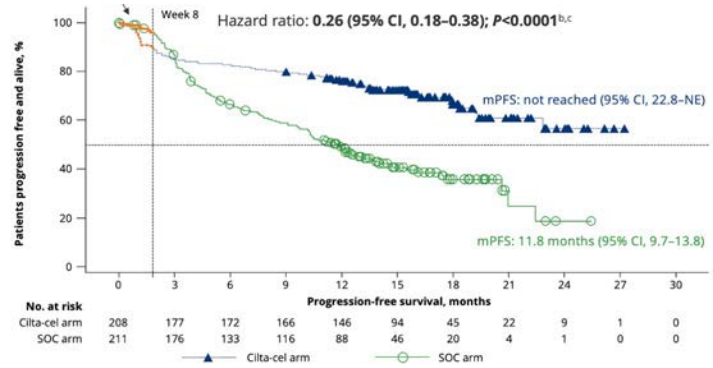


CARTITUDE-4: Study Design and Endpoints

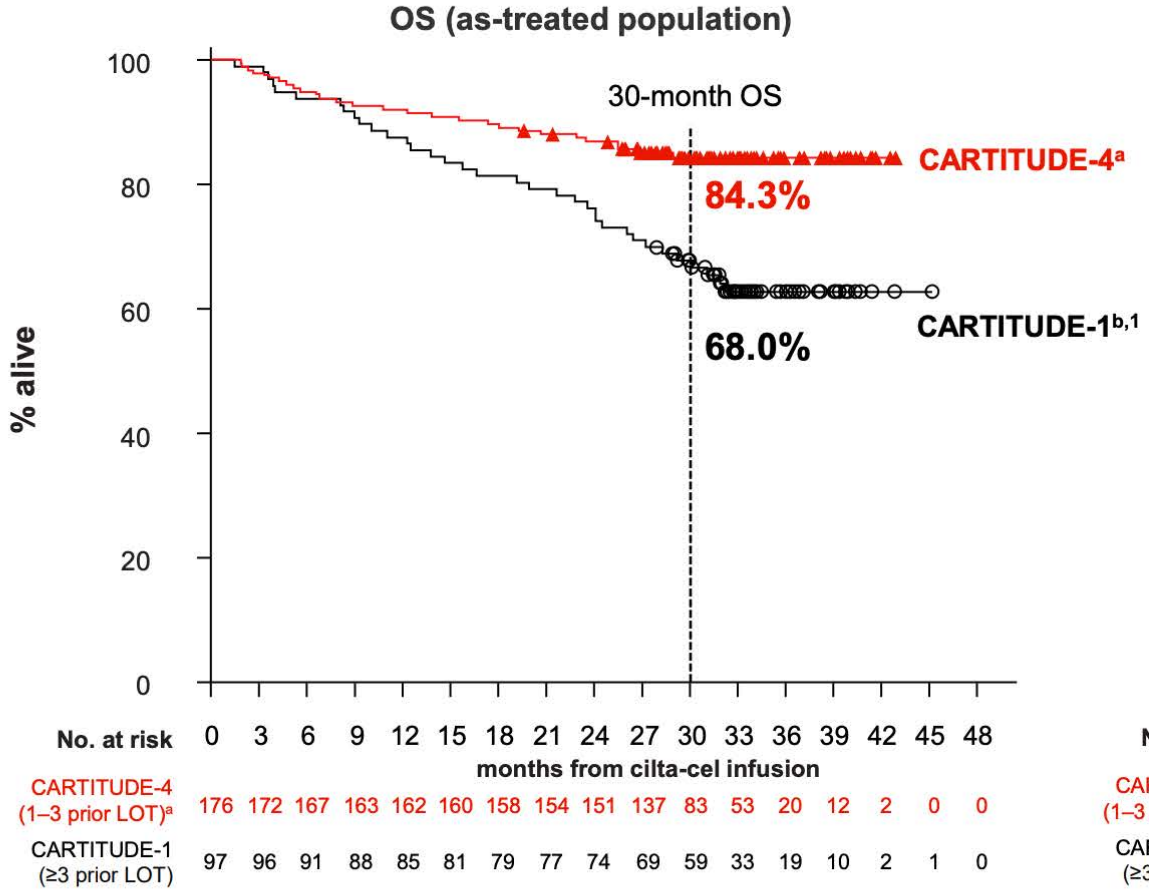


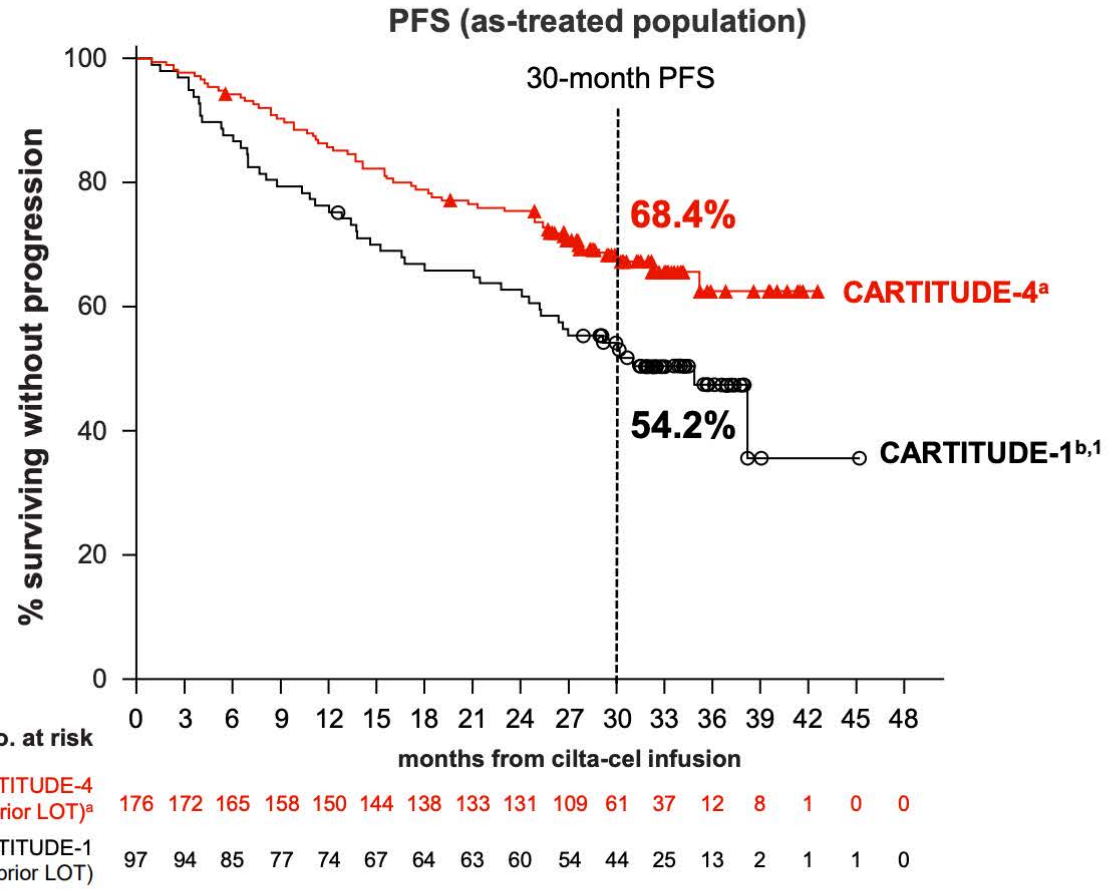
Median 2 PLT (TCR 15%): ORR 99%, PFS NR





Long-Term CARTITUDE-4 Update (34 Months): Numerically Higher Overall and Progression-Free Survival Rates Versus CARTITUDE-1





Cilta-cel use in earlier lines demonstrated numerically higher rates of overall and progression-free survival

[a]Re-baselined to begin at time of cilta-cel infusion for patients who received cilta-cel as study treatment, with median follow-up of 30.5 months. [b]33.4-month median follow-up.
Cilta-cel, ciltacabtagene autoleucel; LOT, line of therapy; OS, overall survival; PFS, progression-free survival; SOC, standard of care.

CARTITUDE-4: CRS and CAR T Neurotoxicity

- CRS occurred in 76.1% of patients and were mostly grade 1/2; all cases resolved[1,2]
- CAR-T cell neurotoxicity occurred in 20.5% of patients; none were fatal, and most were grade 1/2[1,2]
  - All cases of ICANS resolved[1,2]
  - By the CCO, all but 2 of the cranial nerve palsy and 2 of the peripheral neuropathy cases had resolved; the MNT case (grade 1) had not yet resolved by the CCO[1,2]

*Secondary malignancies similar in both arms

AE, n (%)	As-treated population (n=176)			
	Any Grade	Grade 3/4	Median time to onset,[a] days	Median duration,[b] days
CRS	134 (76.1)	2 (1.1)	8	3
Neurotoxicity	36[c] (20.5)	5 (2.8)	–	–
ICANS	8 (4.5)	0[d]	10	2
Other[e]	30 (17.0)	4 (2.3)	–	–
Cranial nerve palsy	16 (9.1)[f]	2 (1.1)	21	77
Peripheral neuropathy	5 (2.8)	1 (0.6)	63	201
MNT	1 (0.6)	0	85	253[g]

[a]Time to onset from cilta-cel infusion. [b]Calculated regardless of resolution of event. [c]Several patients had both ICANS and "other" neurotoxicity. [d]Grade 3 syncope reported as a symptom of grade 2 ICANS. [e]Other neurotoxicities include AEs reported as CAR-T cell neurotoxicity that are not ICANS or associated symptoms. These included (but were not limited to) MNTs, cranial nerve palsy, and peripheral neuropathy. [f]All cases involved cranial nerve VII; 2 cases involved a second cranial nerve (cranial nerves III and V; each n=1). [g]Ongoing at CCO; last known date alive is October 17, 2022 (day 337 post infusion) in this patient.

AE, adverse event; CAR, chimeric antigen receptor; CCO, clinical cut-off; cilta-cel, ciltacabtagene autoleucel; CRS, cytokine release syndrome; ICANS, immune effector cell–associated neurotoxicity; MNT, movement/neurocognitive treatment-emergent adverse event. 1. MagnetisMM-3: Long-Term Update – Survival

PFS and OS

- Median PFS was 17.2 (95% CI 9.8–NE) months (**Figure 1**)
- Median OS was 24.6 (95% CI 13.4–NE) months (**Figure 2**)

Figure 1. PFS

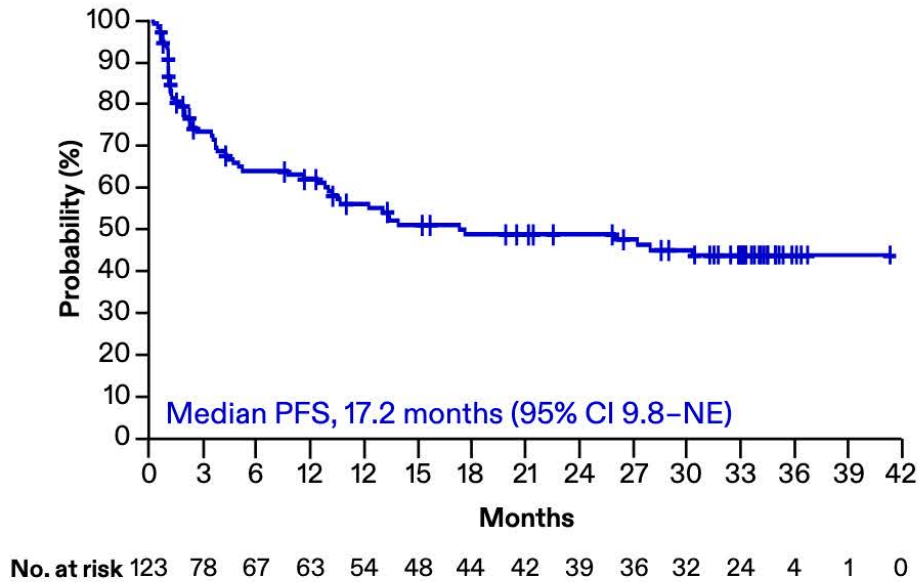

Figure 2. OS

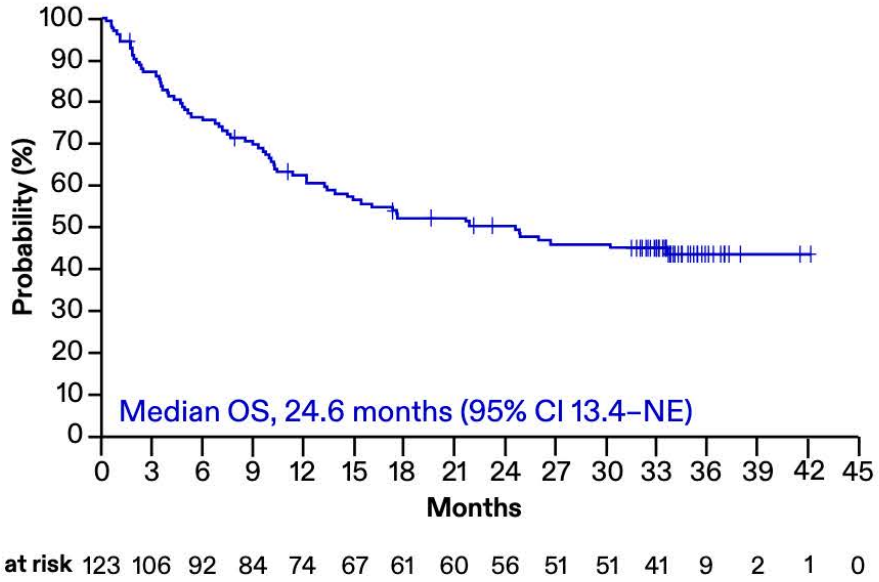


CI = confidence interval; NE = not evaluable; OS = overall survival; PFS = progression-free survival.

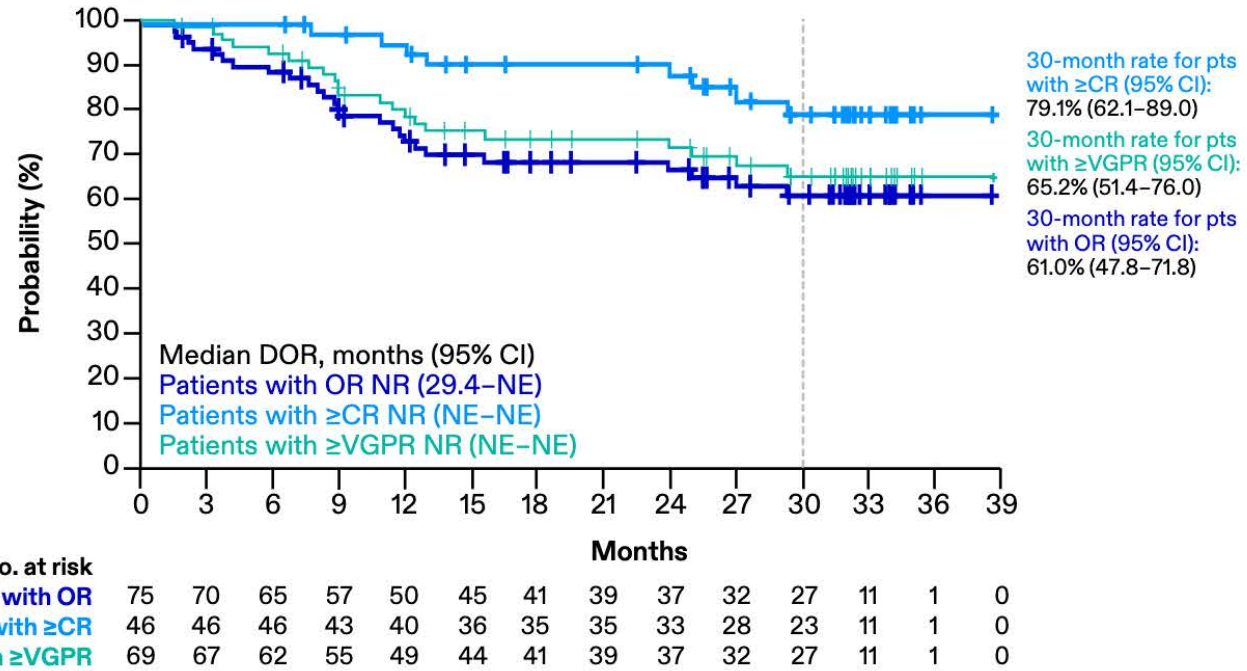
Prince HM et al. Poster presentation at ASH 2024 (Abstract 4738).

MagnetisMM-3: Long-Term Update and Efficacy and Safety of Less Frequent Dosing of Elranatamab in Patients with R/R MM

Efficacy: ORR, MRD Negativity, and DOR

- With extended follow-up, ORR per BICR was 61.0% (≥CR rate 37.4%)
  - sCR, 16.3%; CR, 21.1%; VGPR, 18.7%; PR 4.9%
  - MRD negativity (10^{-5}) rate was 90.3% in patients with ≥CR who were evaluable for MRD (n=31)
- Median DOR was NR (95% CI 29.4–NE) (**Figure**)
- Among responders per BICR who switched to Q4W dosing ≥6 months before the data cutoff (n=27), 25 (92.6%) maintained their response ≥6 months after the switch, including 22 (88.0%) who maintained ≥CR
- 1 (3.7%) patient had PD* and 1 (3.7%) patient permanently discontinued elranatamab 6 months after the switch to Q4W

Figure. DOR



No. at risk														
Pts with OR	75	70	65	57	50	45	41	39	37	32	27	11	1	0

Pts with ≥VGPR	69	67	62	55	49	44	41	39	37	32	27	11	1	0

*Per IMWG criteria in ≥1 assessment.
BICR = blinded-independent central review; CI = confidence interval; CR = complete response; DOR = duration of response; IMWG = International Myeloma Working Group; MRD = minimal residual disease; NE = not evaluable; NR = not reached; OR = objective response; ORR = objective response rate; PD = progressive disease; PR = partial response; Q4W = once every 4 weeks; sCR = stringent complete response; VGPR = very good partial response.

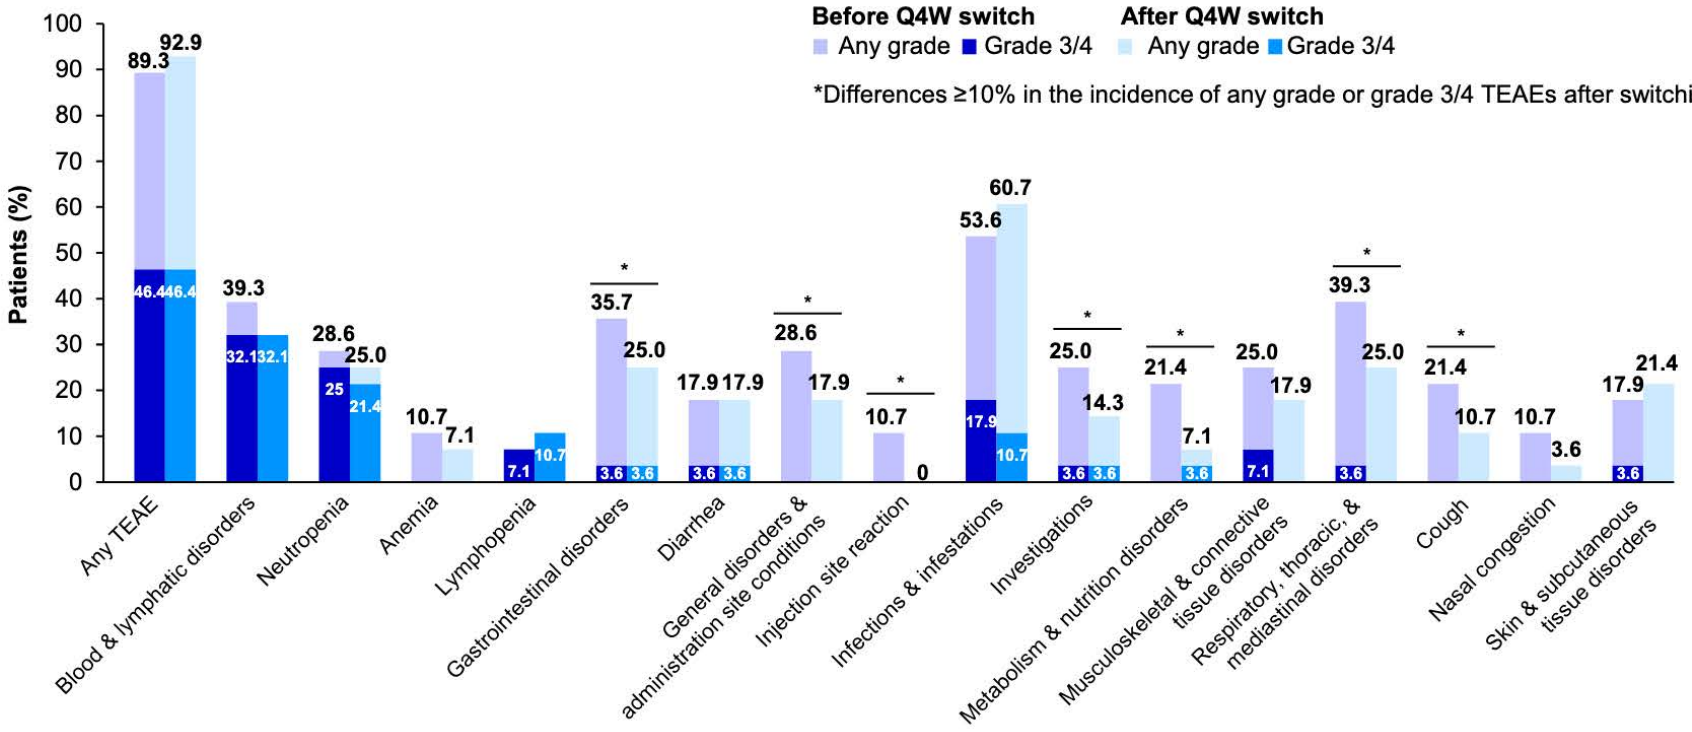
Prince HM et al. Poster presentation at ASH 2024 (Abstract 4738).

MagnetisMM-3: Most Common TEAEs Before and After Switch to Q4W Dosing

Safety

- No new safety signals were observed with extended follow-up
  - Infections: any grade, 70.7%; grade 3/4, 41.5%; grade 5, 7.3%
  - CRS: 57.7%
  - ICANS: 4.9%
- There were 3 new deaths with an additional ~6 months of follow-up since the last report,[1] with 1 each due to PD, treatment toxicity, and unknown reason
- The incidence and severity TEAEs up to 6 months before and after switching to Q4W dosing are presented in the **Figure**

Figure. Most Common TEAEs Before and After Switch to Q4W Dosing†



†TEAEs occurring in ≥20% of patients at the level of SOC and in ≥10% of patients at the level of PT up to 6 months before or after switching to Q2W.
CRS = cytokine release syndrome; ICANS = immune effector cell-associated neurotoxicity syndrome; PD = progressive disease; PT = preferred term; Q4W = once every 4 weeks; SOC = system organ class; TEAE = treatment-emergent adverse event.

Unique Toxicities with GPRC5D:

- Skin and nail: rash, dryness, brittle, nail loss
- Dysgeusia, dry mouth, stomatitis
- Appetite loss and weight loss
- Emerging: neurologic toxicity; dysarthria, dizziness, balance abnl

*Approved by the FDA in August 2023 for adults with R/R MM after ≥4 prior lines of therapy, including a PI, an immunomodulatory agent, and an anti-CD38 mAb †Investigational

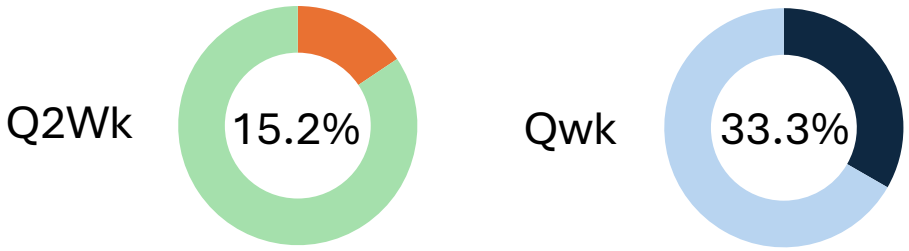
Schinke. ASCO 2023. Abstr 8036. Trudel. ASH 2021. Abstr 157.

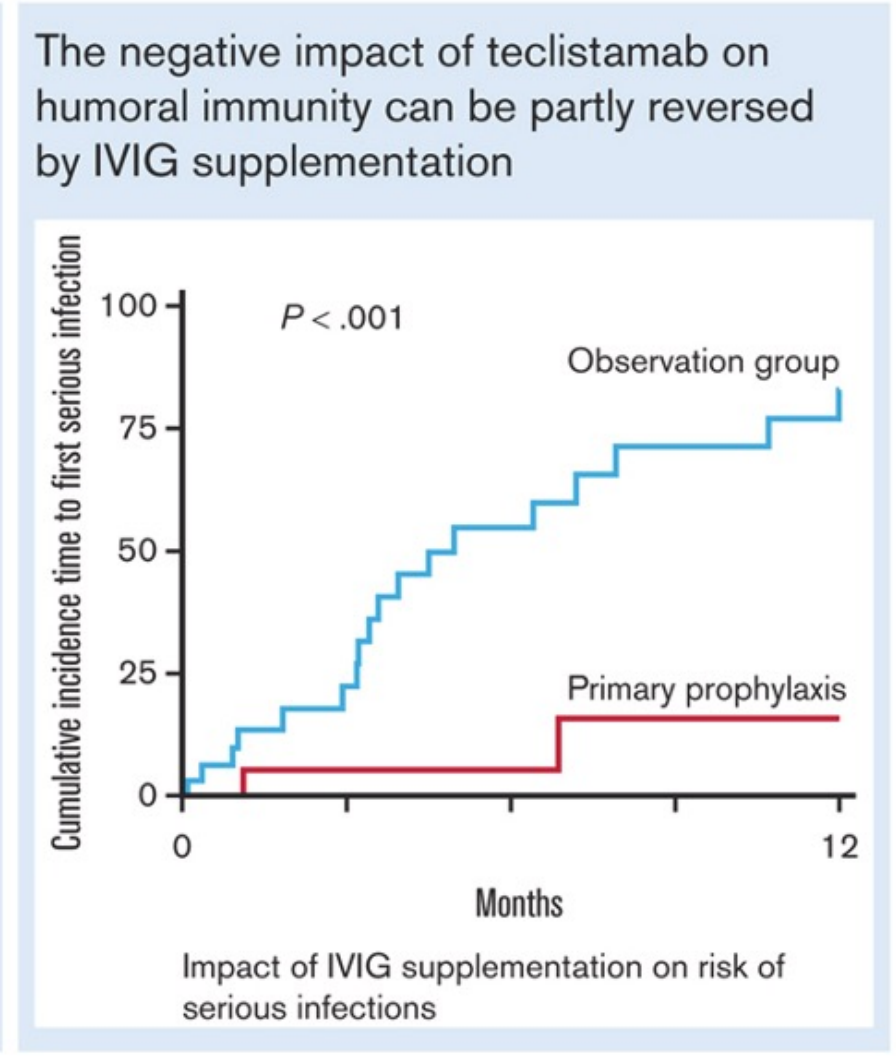
Treatment of Infections

- Infection ➔Bispecific (BCMA >GPRC5D)
  - ACV - throughout treatment *(+3m)*
  - PJP – throughout treatment (+*3m*)
  - Anti-Bact/anti-fungal prn
  - IVIG – while on therapy/until >400

  - Lower infection rates over time have been noted with less frequent dosing

New-onset grade ≥3 infections at 1–1.5 years[1]



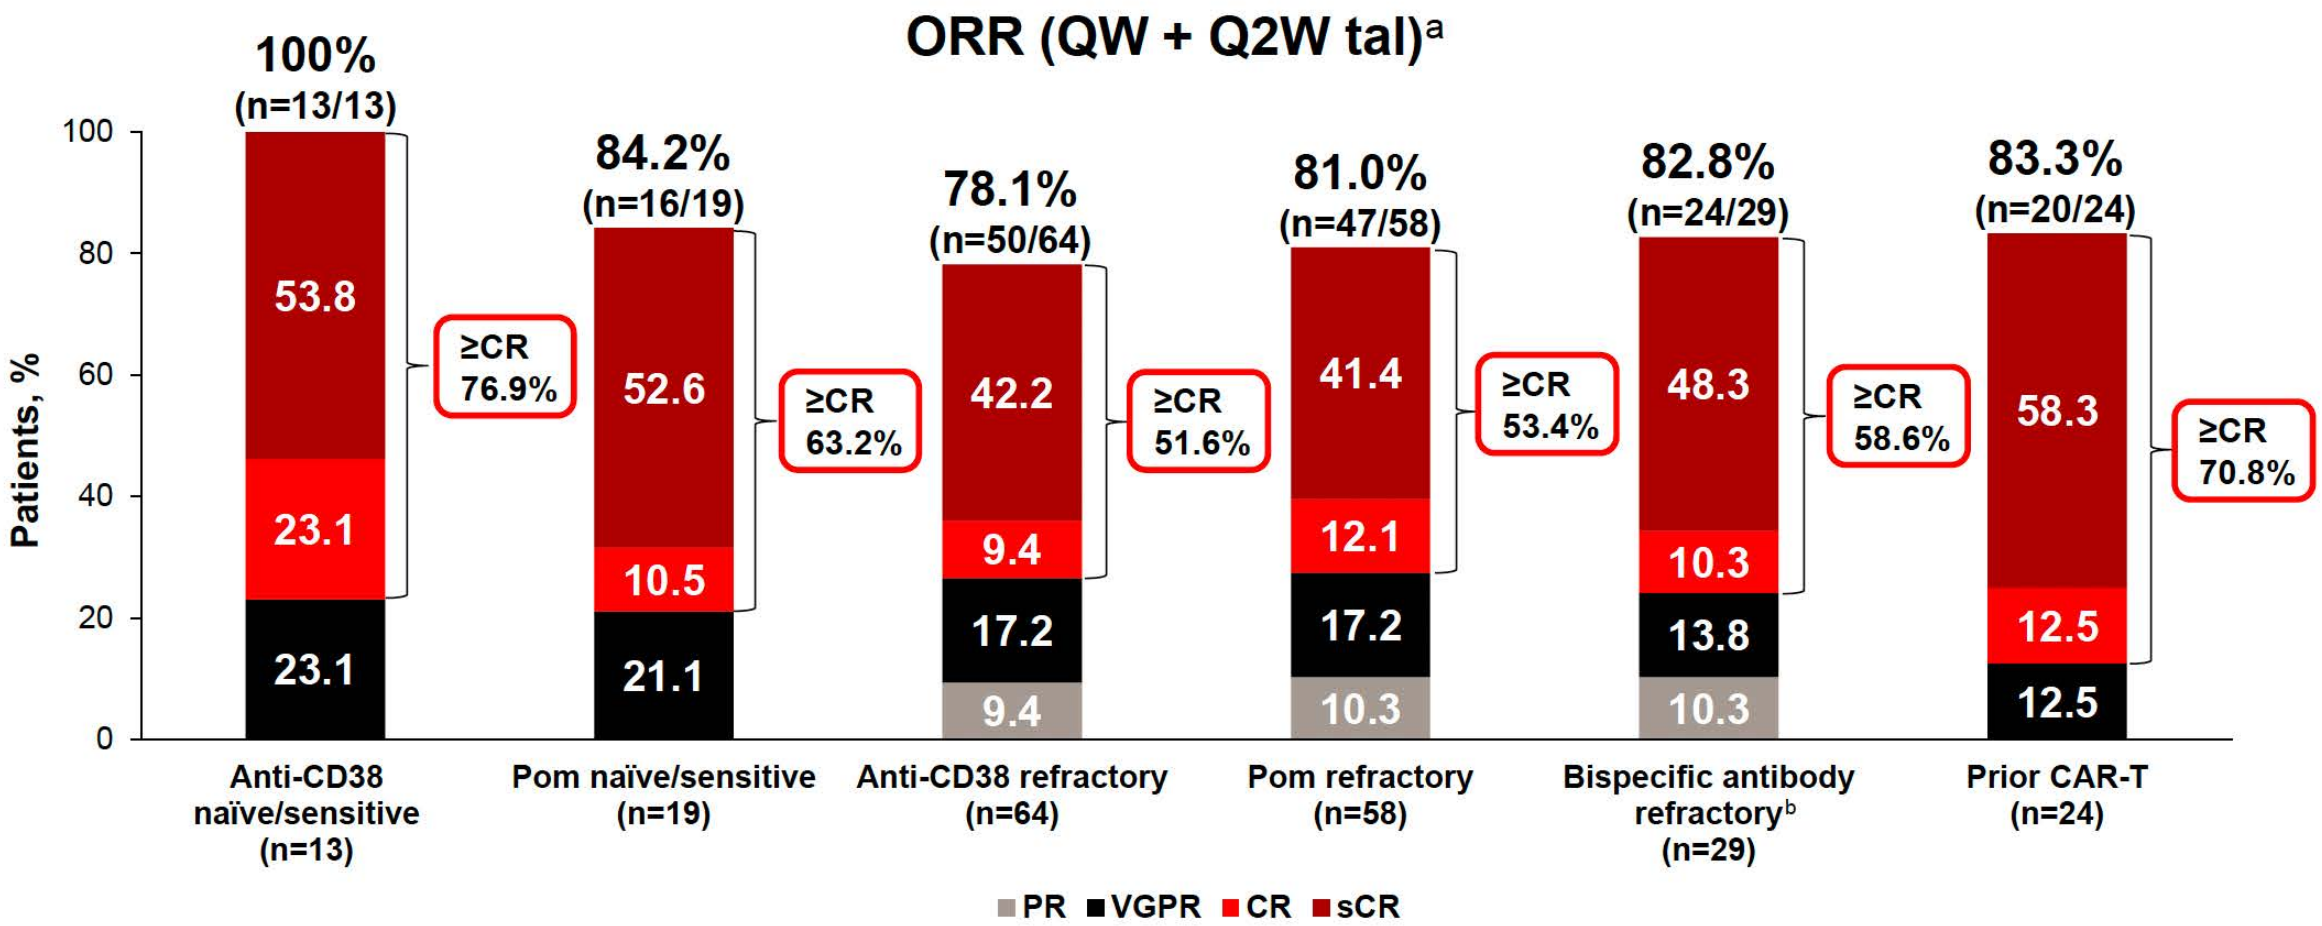


General trend has been for PRIMARY prophylaxis with IVIG (don't wait for infection) especially with BiAbs

- Even in IgG MM with IgG levels >1000mg/dL

Frerich KA et al. Blood Adv 2023, Rodriquez-Otero P et al Lancet Oncology 2024;

TRIMM-2 Tal + Dara + Pom Cohort: High ORRs in Prior Exposure Subgroups

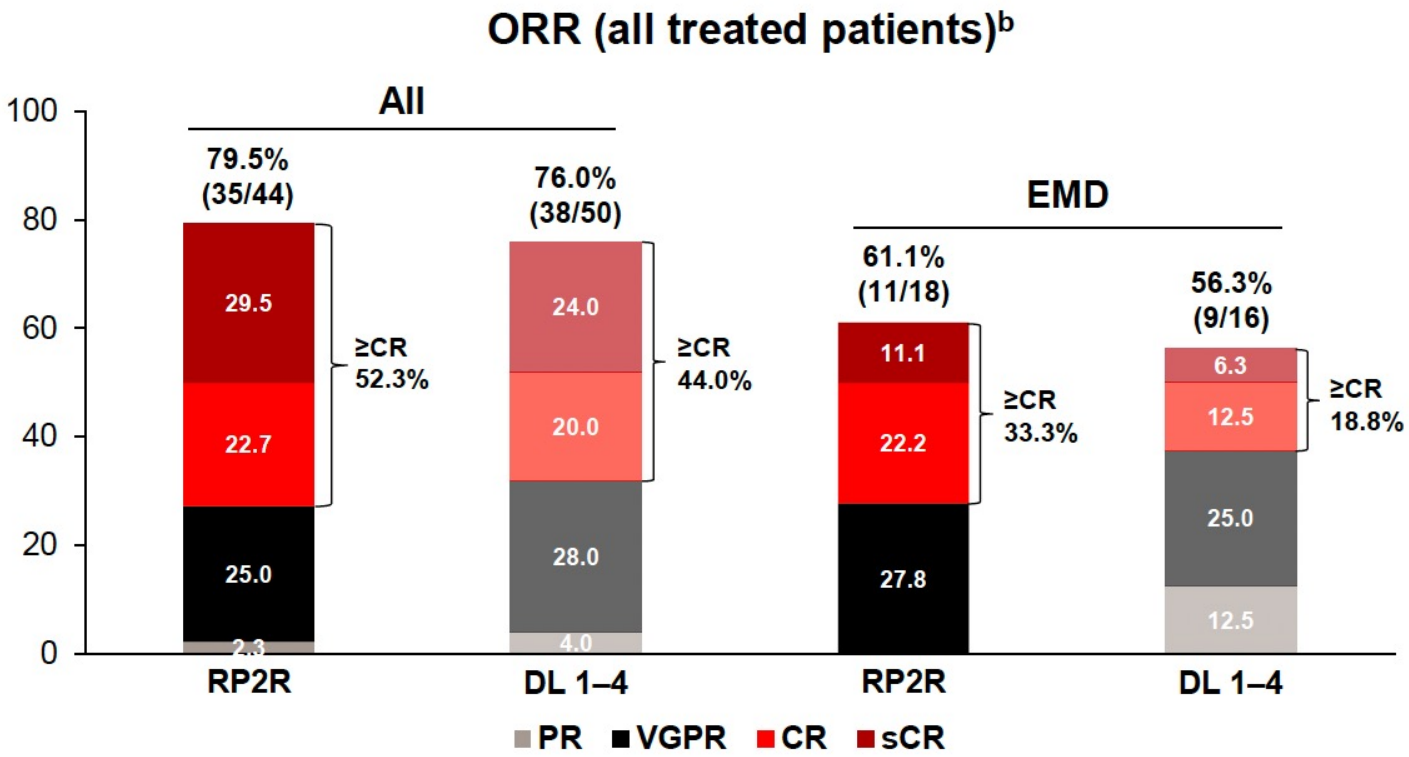


Data cut-off: July 29, 2024.

Anti-CD38 naïve = never received anti-CD38 therapy; anti-CD38 sensitive = minimal response or better during treatment; anti-CD38 refractory = best response of SD or PD during treatment or within 60 days of completing anti-CD38 therapy. [a]Response was assessed by investigators, based on IMWG criteria. Percentages are calculated with the number of patients in each group as denominator. [b]All 29 patients who received prior bispecific antibody therapy were refractory. CAR, chimeric antigen receptor; CR, complete response; dara, daratumumab; IMWG, International Myeloma Working Group; ORR, overall response rate; pom, pomalidomide; PD, progressive disease; PR, partial response; Q2W, every other week; QW, weekly; sCR, stringent complete response; SD, stable disease; tal, talquetamab; VGPR, very good partial response.

Presented by N Bahlis at the 21st International Myeloma Society (IMS) Annual Meeting; September 25–28, 2024; Rio de Janeiro, Brazil

RedirecTT-1 Tal + Tec: High ORR and Deep Responses, Including in EMD[a]



All patients	RP2R (n=44)	DL 1–4 (n=50)
Median (range) follow-up, months	18.2 (0.7–27.0)	29.0 (0.5[c]–37.1)
Median (range) time to first response, months	1.4 (0.3–5.1)	2.1 (1.1–7.7)
Median (range) time to best response, months	4.9 (1.4–19.8)	4.9 (1.1–30.6)

Patients with EMD	RP2R (n=18)	DL 1–4 (n=16)
Median (range) follow-up, months	13.6 (0.7–25.9)	18.7 (0.5[c]–33.8)
Median (range) time to first response, months	3.0 (1.4–5.1)	2.6 (2.1–3.8)
Median (range) time to best response, months	6.3 (3.0–10.7)	3.9 (2.1–10.7)

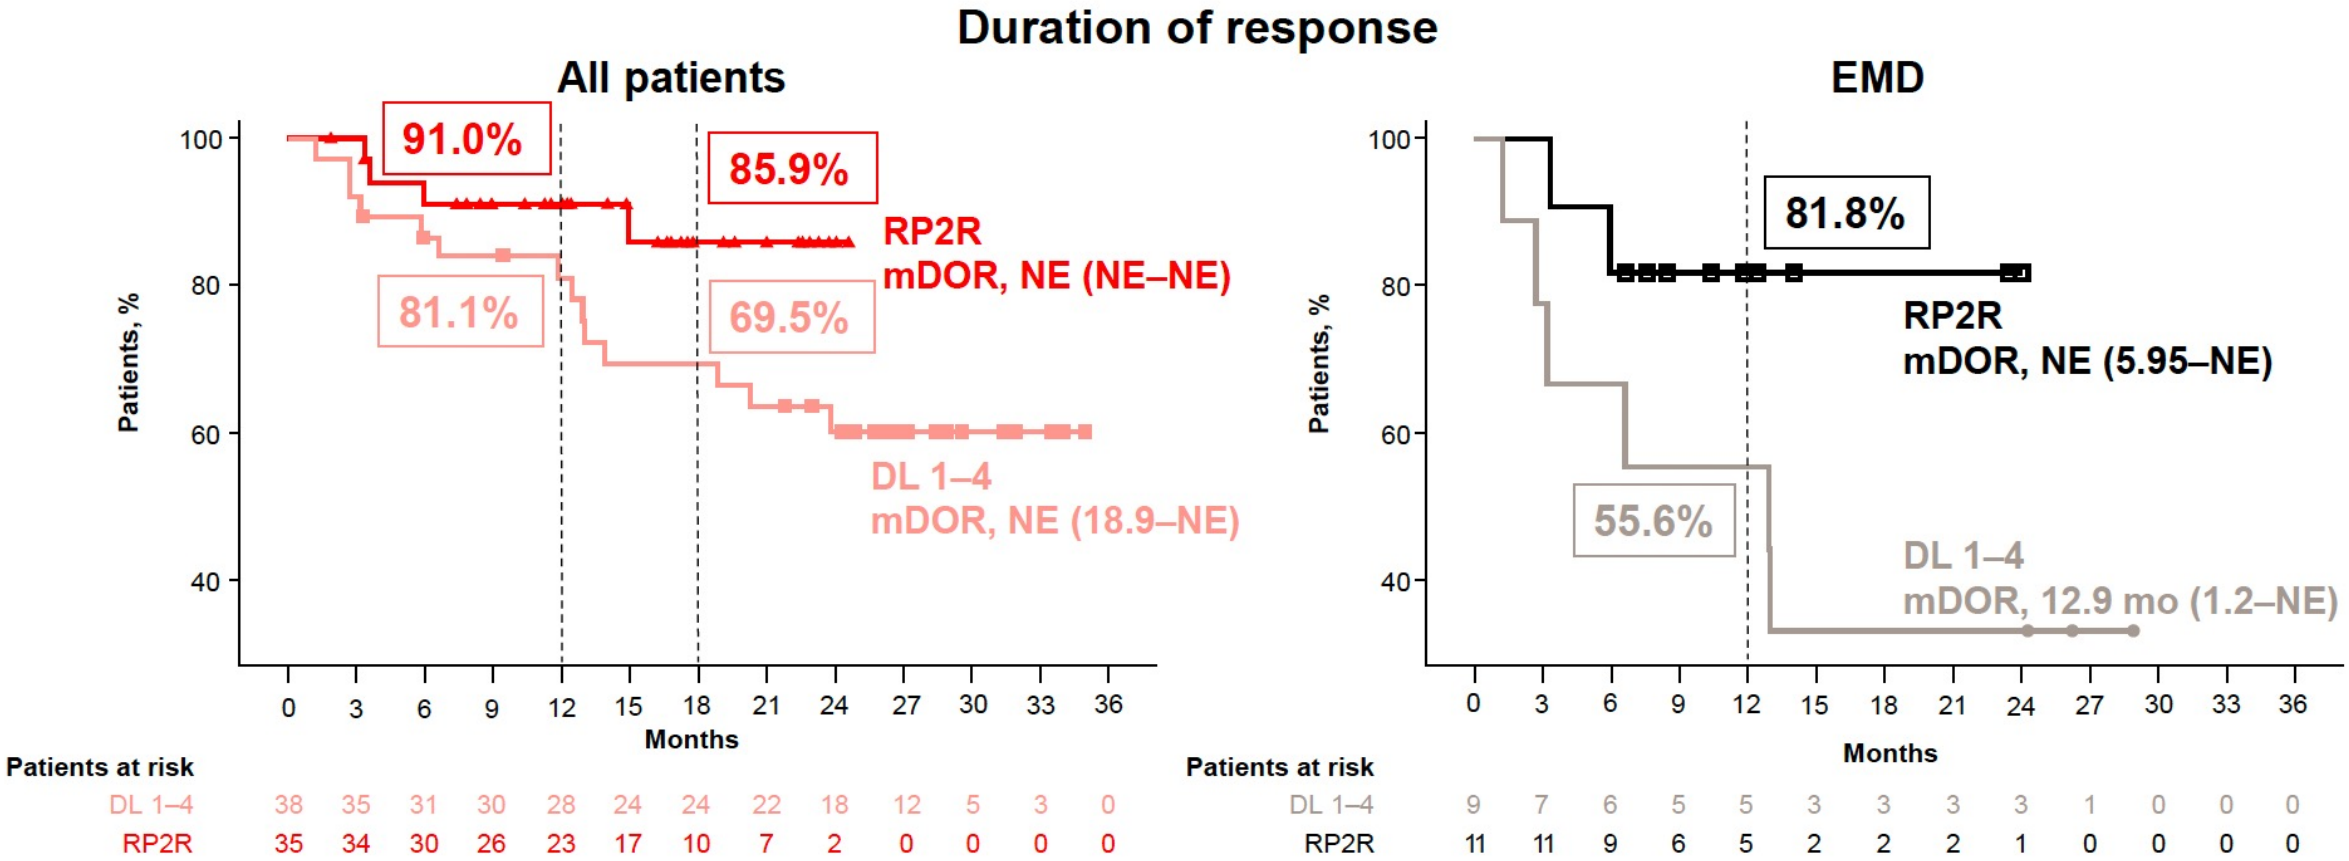
ORR 79.5% (61.1% in EMD) at RP2R with rapid and deep responses

Data cut-off date: March 15, 2024.

[a]EMD defined as ≥1 nonradiated, bone-independent lesion ≥2 cm. [b]Responses were investigator-assessed per IMWG 2016 criteria. Data shown are confirmed responses and calculated in all treated patients. [c]Denotes patients who died. CR, complete response; DL, dose level; EMD, extramedullary disease; IMWG, International Myeloma Working Group; ORR, overall response rate; PR, partial response; RP2R, recommended phase 2 regimen; sCR, stringent complete response; tal, talquetamab; tec, teclistamab; VGPR, very good partial response.

Presented by YC Cohen at the 21st International Myeloma Society (IMS) Annual Meeting; September 25–28, 2024; Rio de Janeiro, Brazil

RedirecTT-1 Tal + Tec: Highly Durable Responses, Including in EMD[a]



18-mo DOR of 85.9% at RP2R (81.8% 12-mo rate in EMD)

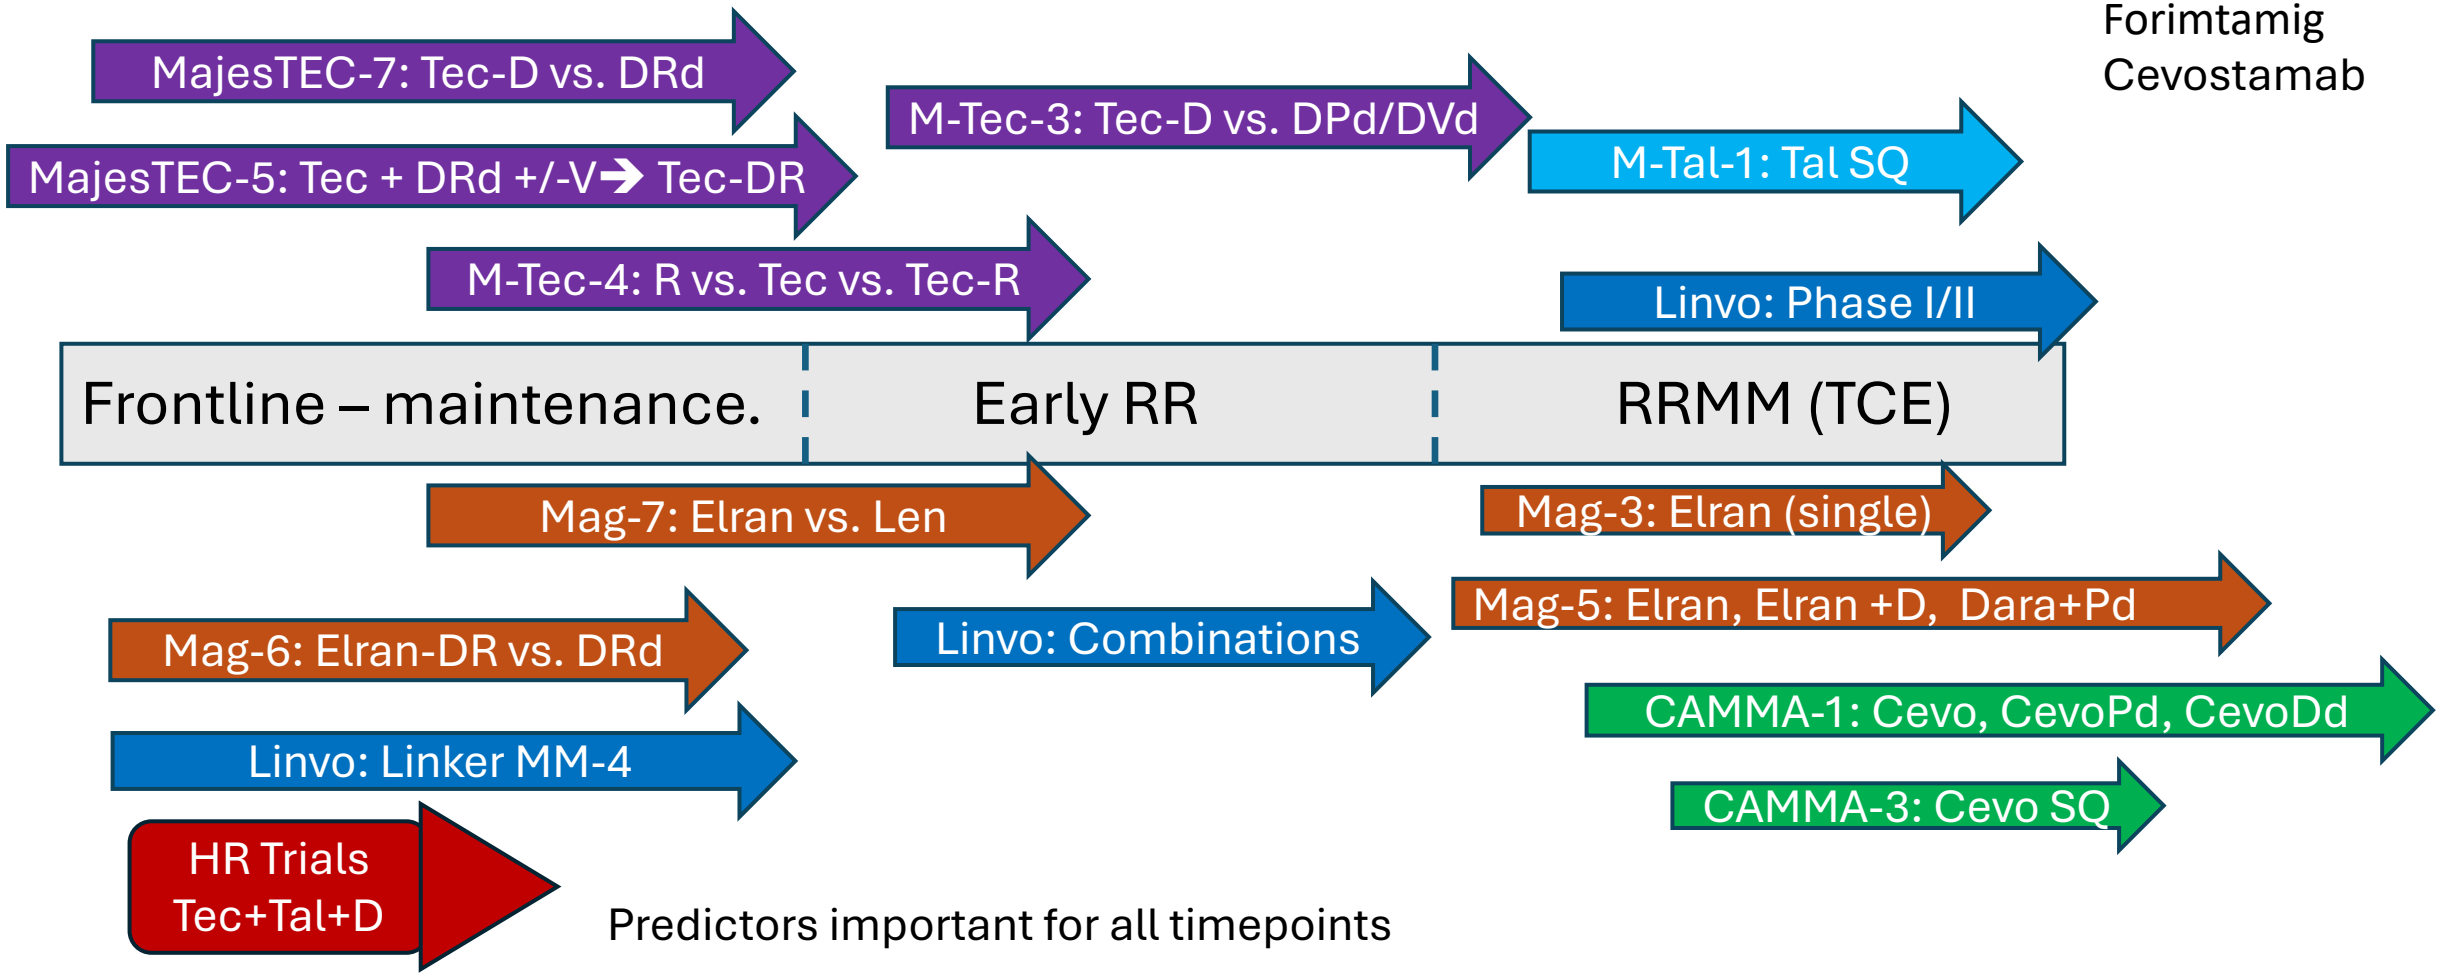
Data cut-off date: March 15, 2024. Median follow-up: 18.2 months (RP2R) and 29.0 months (dose levels 1–4). **Eighteen-month DOR rate at the RP2R was 81.8% in EMD patients.** [a]EMD defined as ≥1 nonradiated, bone-independent lesion ≥2 cm. DL, dose level; EMD, extramedullary disease; mDOR, median duration of response; NE, not evaluable; RP2R, recommended phase 2 regimen; tal, talquetamab; tec, teclistamab.

Presented by YC Cohen at the 21st International Myeloma Society (IMS) Annual Meeting; September 25–28, 2024; Rio de Janeiro, Brazil

Immunotherapy Bispecific Trials

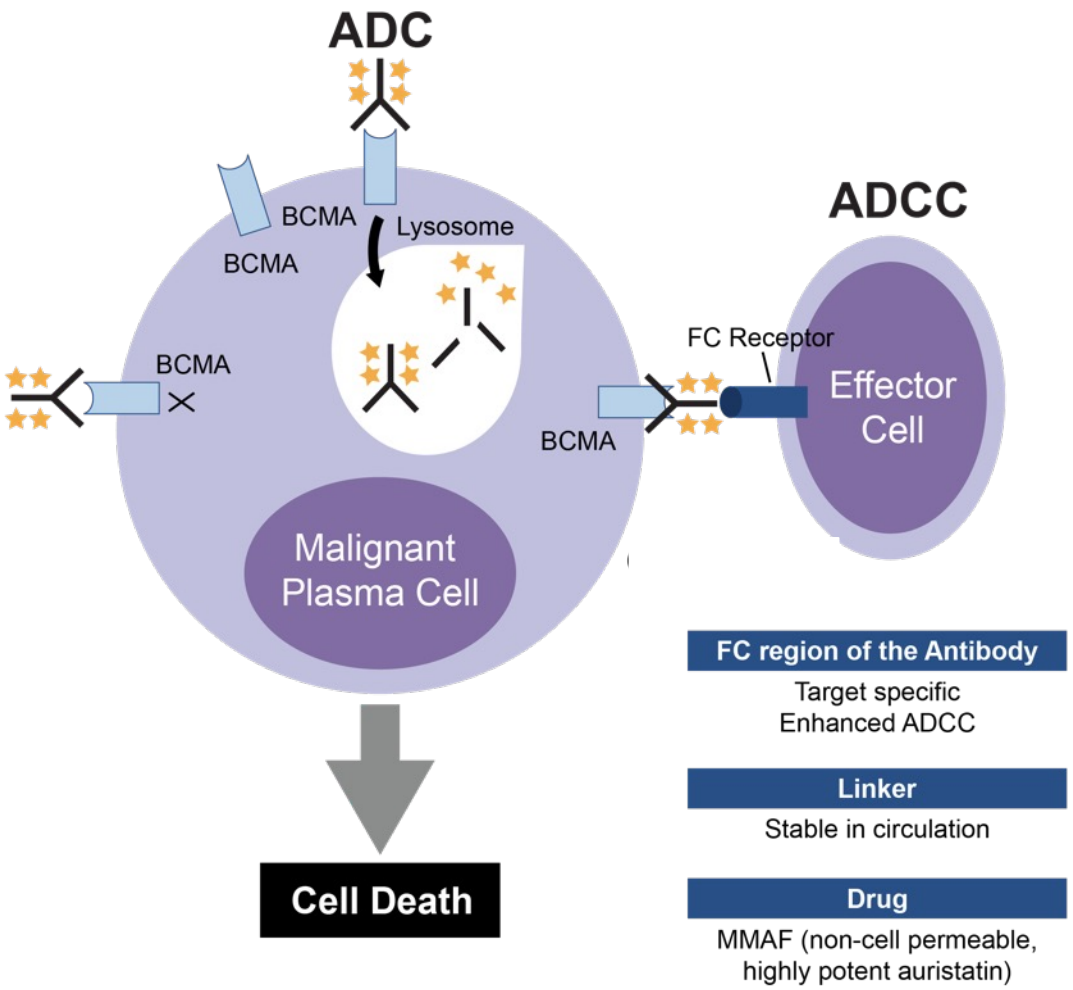
Current and planned (not inclusive of all trials)

- Myeloma Treatment Paradigm



BCMA
Teclistamab
Elranatamab
Linvoseltamab
ABBV-383
Non-BCMA
Talquetamab
Forimtamig
Cevostamab

BCMA: Antibody-drug conjugate (ADC) - Belantamab



- Belantamab mafodotin is a humanized, afucosylated IgG1 anti-BCMA antibody conjugated to monomethyl auristatin (MMAF)
- FDA approved for patients previously treated with 4 ***prior therapies*** then withdrawn due to failed P3 trial B vs. Pd.

- DREAMM-7 – Phase 3: 494 patients
  - Randomized: BVd vs. DVd – RRMM 1-3 PLT
- DREAMM-8 – Phase 3:
  - Randomized P3: BPd vs. PVd

Single agent activity in RRMM => ORR 32%

- **Comeback-Kid of the year!!**

DREAMM-7: **BVd**

- Improved
  - ORR
  - CR
  - ≥ VGPR

DREAMM-7: deeper responses with BVd vs DVd[a]

≥ CR MRD negativity[b]:

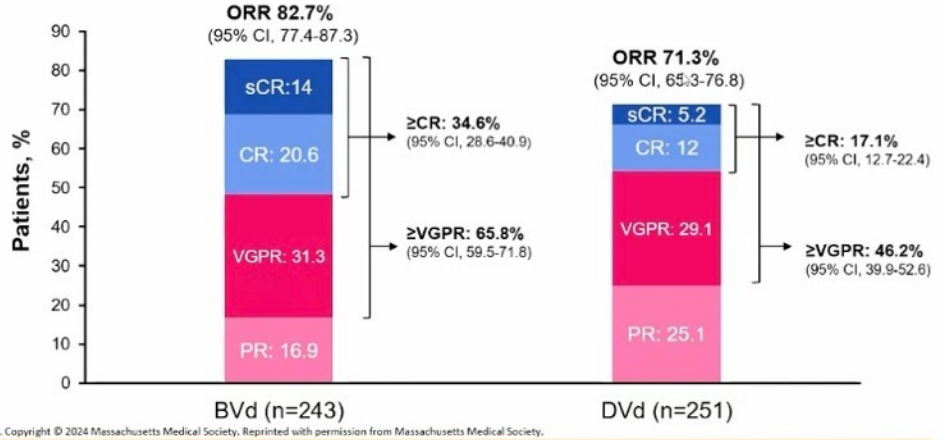
24.7% vs 9.6%

(95% CI, 19.4-30.6) (95% CI, 6.2-13.9)

≥ VGPR MRD negativity[b]:

38.7% vs 17.1%

(95% CI, 32.5-45.1) (95% CI, 12.7-22.4)



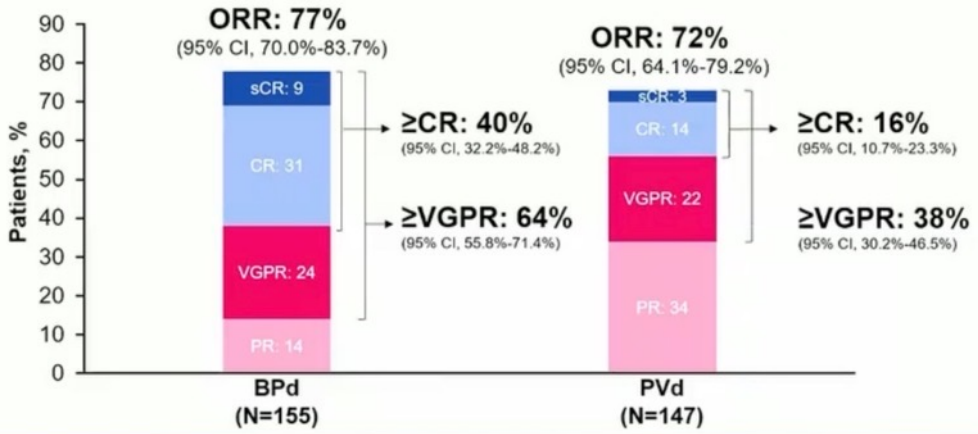
BVd was associated with a greater depth of response with double the ≥CR rate and more than double the MRD negativity rates (sensitivity of 10^{-5}) of DVd (*P* value <.00001)[c]

, complete response; DVd, daratumumab, bortezomib, and dexamethasone; ITT, intent to treat; MRD, minimal residual disease; NGS, next-
national Staging System; sCR, stringent complete response; VGPR, very good partial response.
ulation were randomized, not treated, rescreened, and rerandomized. They are counted as 4 unique patients in this output. [b]MRD negativity
e by NGS based on a sensitivity of 10^{-5}. [c]Nominal *P* value. Cochran–Mantel–Haenszel test was used and adjusted for stratification factors,
ortezomib, and R-ISS stage at screening (I vs II or III).

9

DREAMM-8 | Belantamab Mafodotin + Pd

Deeper Responses With BPd vs PVd



The CR or better rate in the BPd arm was more than twice that in the PVd arm

CIs were based on the exact method. All percents are based on the ITT population.
BPd, belamaf, pomalidomide, and dexamethasone; CR, complete response; ITT, intent to treat; ORR, objective response rate; PR, partial response; PVd, pomalidomide, bortezomib, and dexamethasone; sCR, stringent complete response; VGPR, very good partial response.

13

DREAMM-7: **BPd**

Median PFS (95% CI), months	NR (20.6-NR)	12.7 (9.1-18.5)
HR (95% CI); *P* value	0.52 (0.37-0.73); <.001	

DREAMM-7: impact of dose modifications on PFS and ocular management[a]

	≤3	>3 to ≤6	>6 to ≤9	>9 to ≤12	>12 to ≤15	>15 to ≤18	>18 to ≤21	>21 to ≤24	>24 to ≤27	>27 to ≤30	>30 to ≤33	>33 to ≤36
No. of patients on treatment[e]	211	170	147	131	117	110	102	97	93	69	42	20
No. of patients with bilateral 20/50 or worse	49	27	23	15	11	14	12	7	10	3	3	1
Median days between doses	21	42	41	55	54	77	63	79	84	84	53	74
No. of patients who discontinued due to KVA or ocular CTCAE event	7	5	3	2	1	1	0	0	1	1	0	0

- Median time between doses increased with treatment duration
- **Dose delays did not have a negative impact on PFS[d]**
  - BVd patients with ≥1 dose delay of ≥12 weeks (N= 126), **mPFS 36.6 months**
- 23% of patients experienced 20/50 or worse events in first 3 months; prevalence decreased thereafter
- Rate of treatment discontinuation due to ocular events were low

CTCAE, Common Terminology Criteria for Adverse Events; KVA, Keratopathy and Visual Acuity scale; mPFS, median progression-free survival; PFS, progression-free survival; PD, progressive disease.
[a] Only belantamab mafodotin treatment period considered in these post hoc analyses. [b] Only patients with 20/25 or better in either or both eyes at baseline are considered. [c] Mean of days between doses, for each patient, per interval is used. [d] Only patients receiving ≥6 months of treatment included in analysis to exclude early discontinuations (eg, rapid PDs). [e] Graph is truncated at 36 months because the data beyond 36 months represented a low number of patients on treatment (>36 to ≤39 months, n=8 and >39 to ≤42 months, n=3).

Summary

- CAR-T therapy and bispecifics: Unprecedented response rates/PFS in triple class refractory MM.
- CRS and ICANS are manageable.
- Cytopenias and infections are common, can be long term in a subset of patients.
- Delayed neurotoxicity can occur with both CARS and Bispecifics (BCMA and GPRC5D)
- BCMA ADC – in combination data very promising
- Selecting which therapy, when and Sequencing are key questions
- New unmet need: Relapse after BCMA therapies. Non-BCMA targets have shown promising activity.

Discussion Questions

- Regulatory and reimbursement issues aside, what do you currently believe is the optimal point at which CAR T-cell therapy should be administered for patients with high-risk MM? What about for patients with lower-risk disease?

- Based on your personal clinical experience and knowledge of available data, how would you compare the global efficacy and tolerability and complications of idecabtagene vicleucel to that of ciltacabtagene autoleucel for R/R MM?

Discussion Questions

- In general, when administering a bispecific antibody to a patient with relapsed/refractory MM, what is your preferred agent? How does prior therapy impact your choice?

- How would you indirectly compare the efficacy and tolerability of the available bispecific antibodies? Which adverse events are commonly observed in patients receiving talquetamab but NOT in those receiving BCMA-targeted bispecific antibodies, such as teclistamab or elranatamab?

Discussion Questions

- Based on recent data, if belantamab mafodotin becomes available, to which patients with MM would you like to administer it? What agent(s) would you partner it with?

- Based on available data and your personal clinical experience, do you believe that belantamab mafodotin is as efficacious in patients with relapsed/refractory MM who have received a BCMA-targeted bispecific antibody or CAR T-cell therapy as those who have not?

HIMALAYA study design

HIMALAYA was an open-label, multicenter, global, Phase 3 trial

Study population
- Patients with confirmed uHCC
- BCLC B (not eligible for locoregional therapy) and C
- No prior systemic therapy
- ECOG PS 0–1
- Child-Pugh A
- No main portal vein thrombosis
- EGD was not required

Stratification factors
- Macrovascular invasion: Y / N
- Etiology of liver disease: HBV / HCV / others
- Performance status: ECOG 0 / 1

R
N=1324

T300+D (n=393):
Tremelimumab 300 mg × 1 dose + durvalumab 1500 mg Q4W*

Durvalumab (n=389):

1L TKIs in Advanced HCC

- Sorafenib
- Lenvatinib
- Who should receive a TKI in 1L?
  - History of autoimmune disease (Crohn's, AI hepatitis, MS, RA, etc.)
  - Post-organ transplantation incl. liver

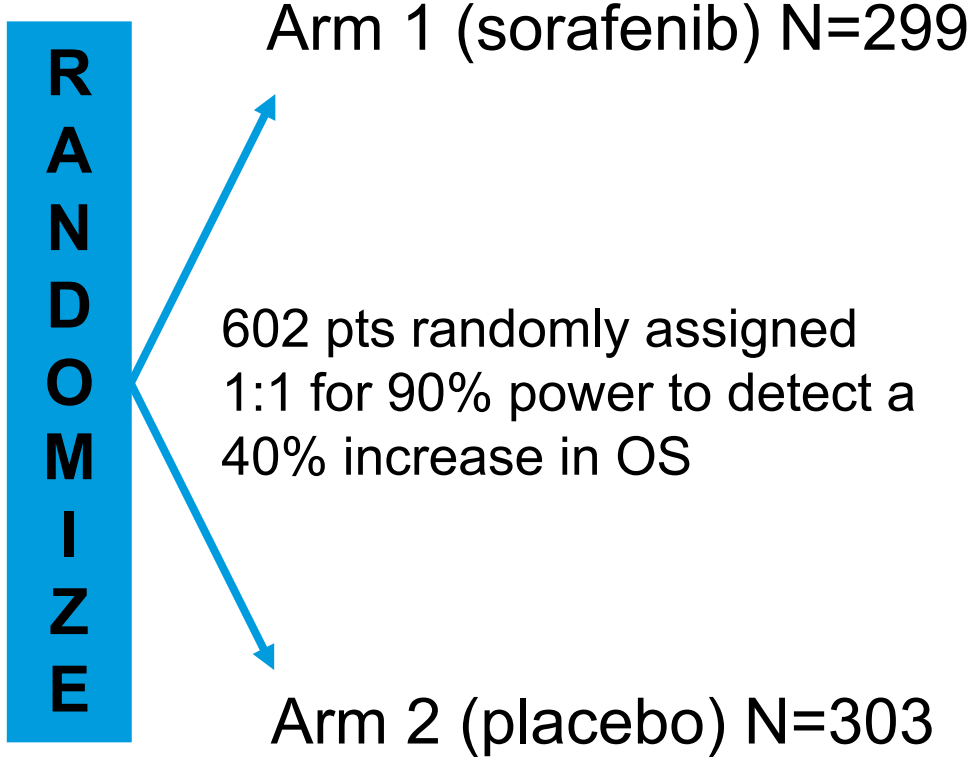
SHARP: Phase III Trial of Sorafenib in Advanced HCC

Eligibility

Advanced stage HCC
ECOG PS ≤2
Child-Pugh A
No prior treatment
Age ≥18 years

Study Design

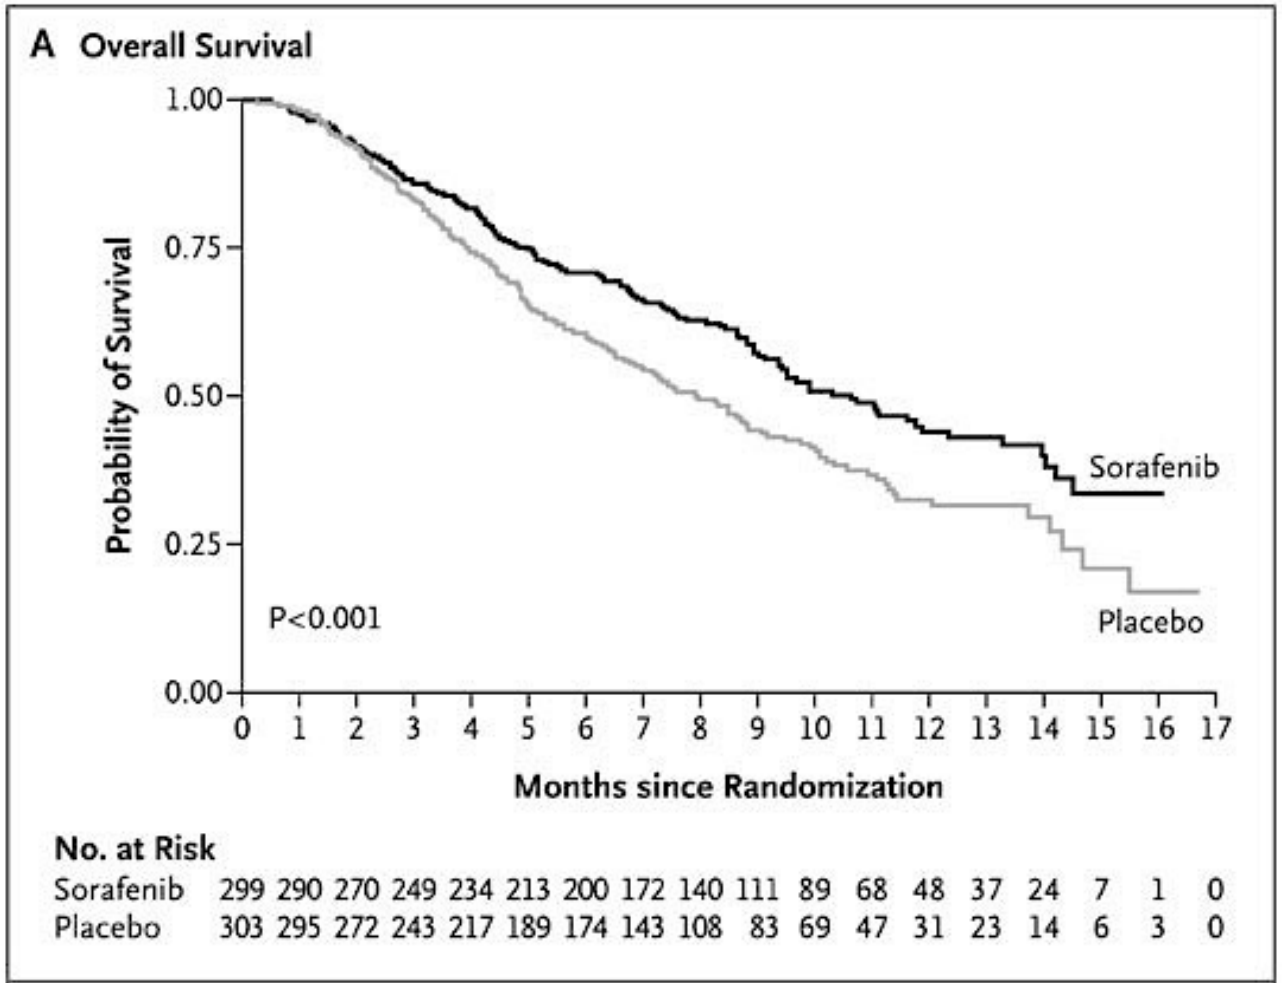
Double blind, placebo-controlled
121 sites primarily in North America and Europe
Primary end point: OS



OS = overall survival

Llovet et al, N Engl J Med 2008

SHARP: Overall Survival



Llovet et al, N Engl J Med 2008

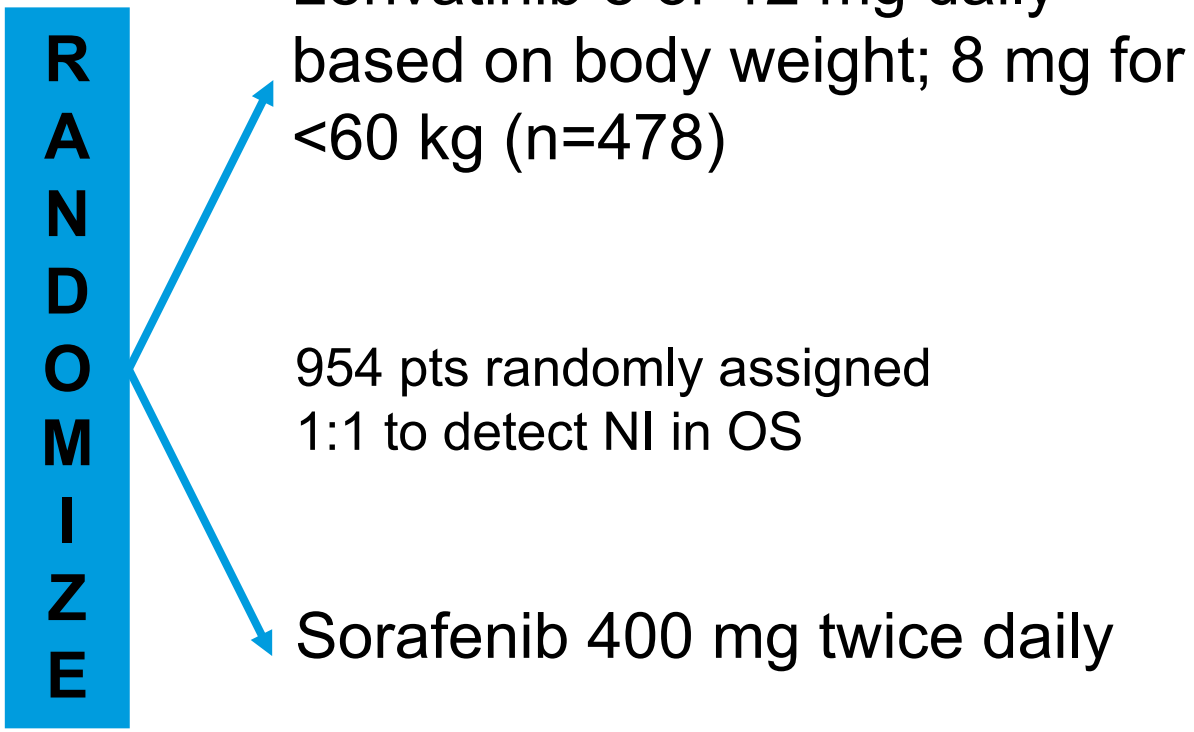
REFLECT: Lenvatinib vs Sorafenib in 1L for Advanced HCC

Eligibility

- Unresectable HCC with no prior treatment
- ECOG PS 0 or 1
- BCLC stage B or C
- Child-Pugh A
- Age ≥18 years

Study Design

- Phase III, open-label, randomized NI study
- Primary end point: OS
- Secondary end points: PFS, TTP



NI = noninferiority; PFS = progression-free survival

Cheng et al, 2017

REFLECT: Outcomes

Outcomes	Lenvatinib	Sorafenib	HR
Median OS, mo (95% CI)	13.6 (12.1-14.9)	12.3 (10.4-13.9)	0.92 (0.79-1.06)
Median PFS, mo (95% CI)	7.4 (6.9-8.8)	3.7 (3.6-4.6)	0.66 (0.57-0.77)
Median TTP, mo (95% CI)	8.9 (7.4-9.2)	3.7 (3.6-5.4)	0.63 (0.53-0.73)
ORR, n (%)	115 (24%)	44 (9%)	

Cheng et al, 2017

Discussion Questions

- Regulatory and reimbursement issues aside, which first-line systemic treatment would you most likely recommend for a 65-year-old patient with HCC and a Child-Pugh A score? What would you recommend if the patient had Grade 1 esophageal varices being managed with a beta blocker? What if the patient had a history of recurrent deep vein thrombosis?

Discussion Questions

- Regulatory and reimbursement issues aside, which first-line systemic treatment would you most likely recommend for a 78-year-old patient with HCC, a Child-Pugh B7 score and a PS of 1?

- What would be your most likely second-line systemic therapy for a 65-year-old patient with HCC, a Child-Pugh B7 score and a PS of 1 who received first-line atezolizumab/bevacizumab with minimal toxicity, had stable disease for 14 months and then experienced disease progression (AFP = 2,500 ng/mL)?

Discussion Questions

- What would be your most likely third-line systemic therapy recommendation for an otherwise healthy 65-year-old patient with HCC who experienced disease progression on first-line atezolizumab/bevacizumab and second-line lenvatinib (AFP = 2,500 ng/mL)?

IMPORTANT DRUG WARNING

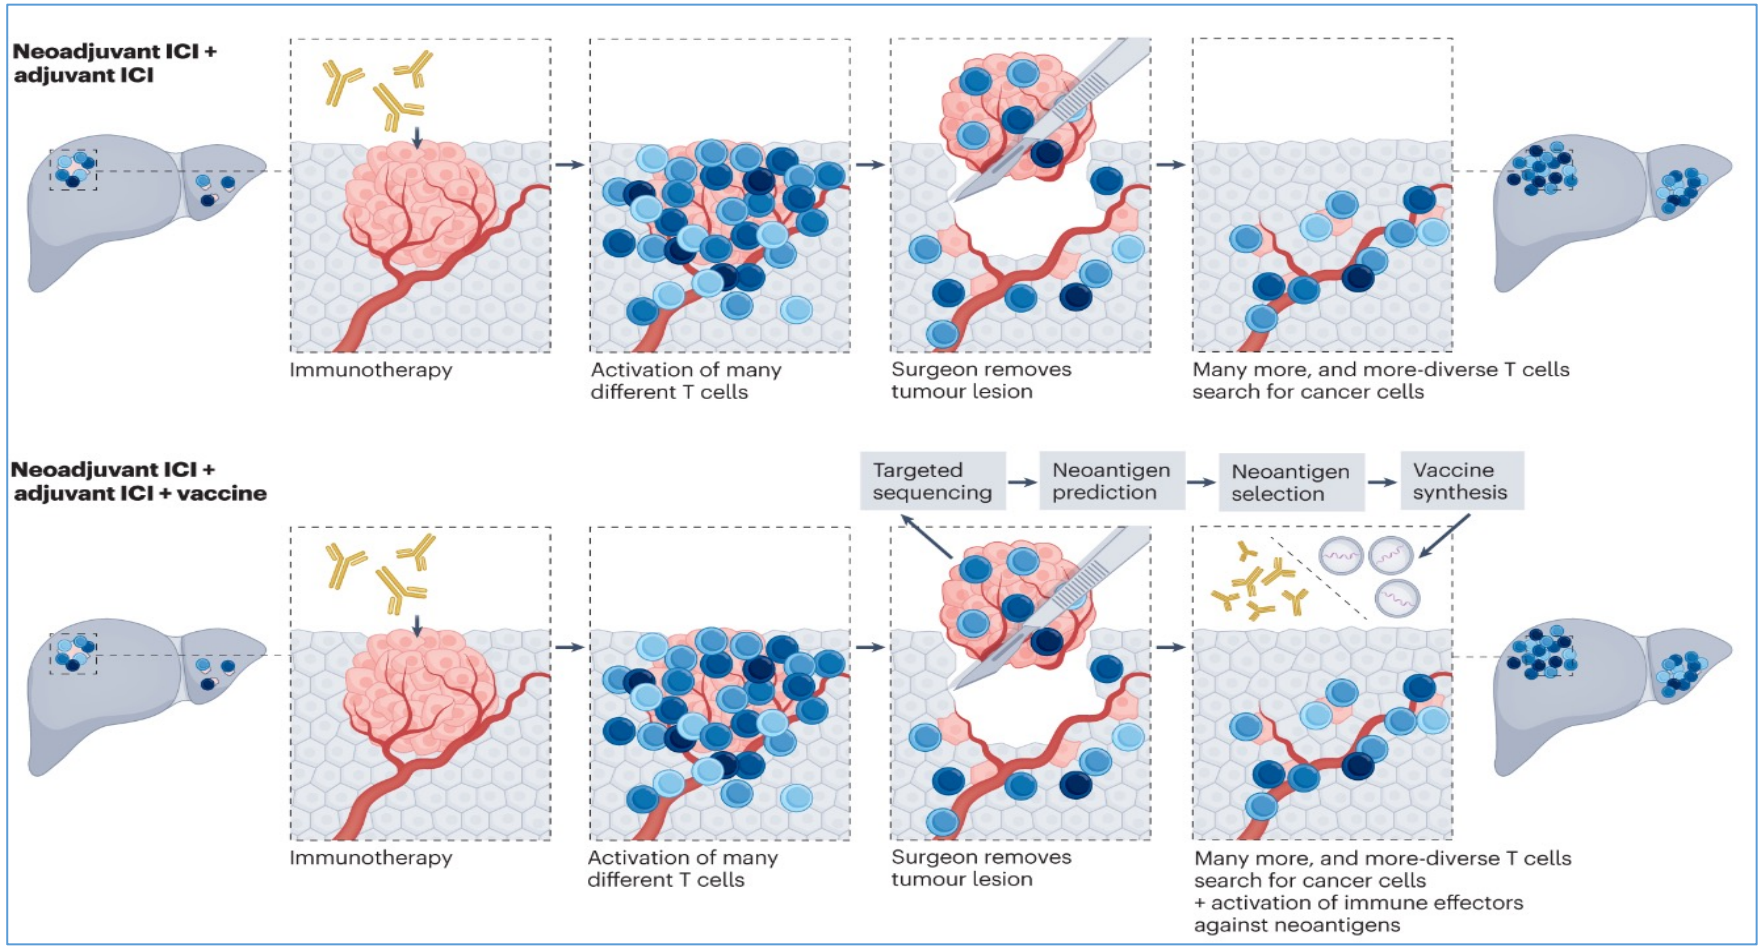
Subject:
Atezolizumab in combination with bevacizumab is NOT approved as adjuvant therapy in patients with hepatocellular carcinoma at high risk of recurrence after surgical resection or ablation and should not be used in this setting.

Prescriber Action

Do not prescribe off-label use of atezolizumab in combination with bevacizumab for the adjuvant treatment of HCC.

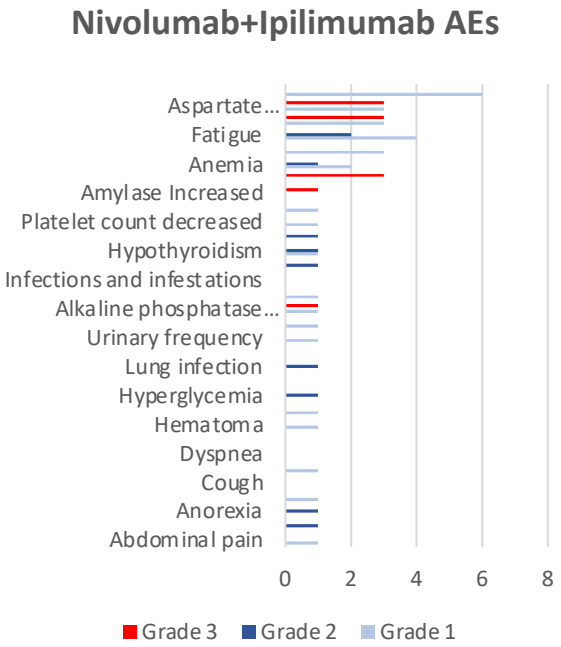
How about neoadjuvant and perioperative setting?

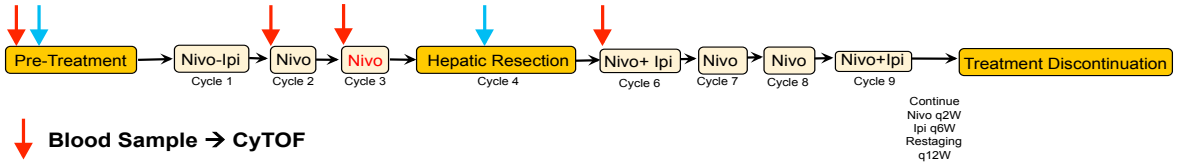
Mechanism of action of immunotherapies and vaccines in the neoadjuvant and adjuvant setting in

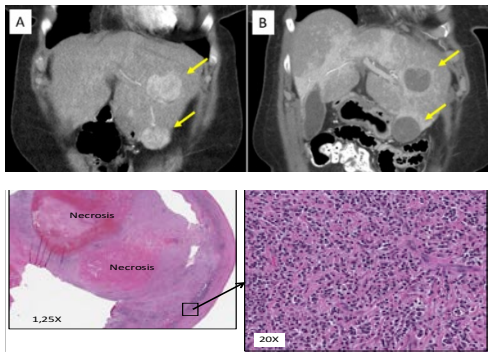


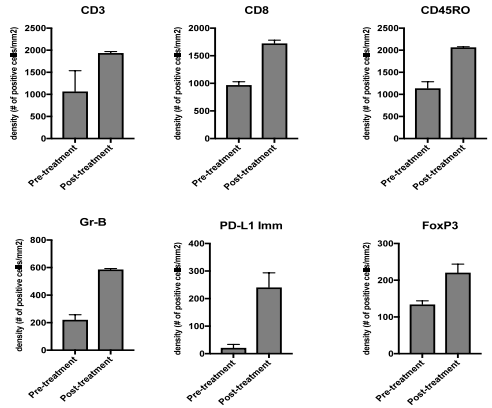
Llovte JM, *Nature Reviews Clinical Oncology* **volume 21**, pages294–311 (2024)

Perioperative Phase II Study Evaluating Nivolumab Alone versus Nivolumab plus Ipilimumab in Resectable HCC









No AEs led to cancellation of surgery

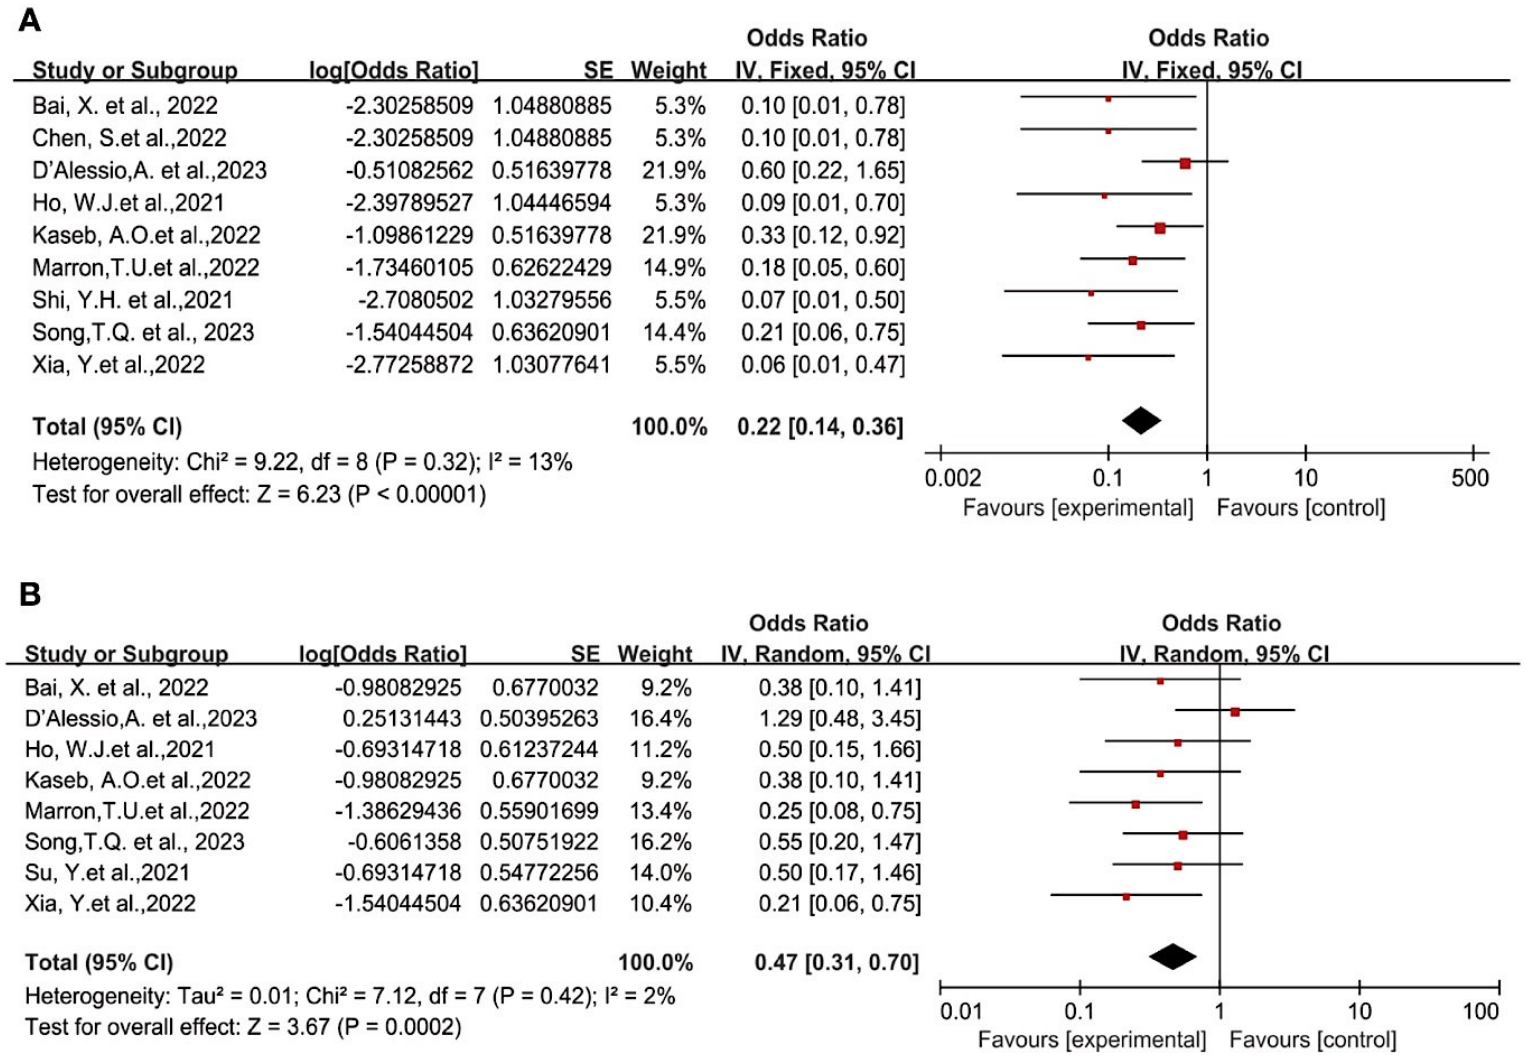
Most grade 3-4 treatment related toxicity occurred during adjuvant therapy after surg.

6/20 (30%) achieved pathologic response (5 had path CR and 1 >50% necrosis)

- CR correlated with a strong increase in CD8+ T cell infiltration
- 11-fold increase in CD3+CD8+CD45RO+Eomes+ clusters
- 6-fold increase in CD3+CD8+CD45RO+Eomes+CD57+CD38low clusters
- CD8+cytotoxic T cells : Tregs ratio→ increased significantly after therapy

Kaseb AO, et al. Lancet Gastroenterol Hepatol. 2022

Forest plot of the efficacy of neoadjuvant immune checkpoint inhibitors in resectable HCC. (A) pCR, (B) MPR



Tian C, et al. Front. Immunol., 18 February 2024

Neoadjuvant Atezolizumab Plus Bevacizumab Is Also Being Assessed (MDACC)

Atezolizumab + Bevacizumab Before Surgery for the Treatment of Resectable Liver Cancer[1]

EMERALD-3 Study Design: Durva + Treme + TACE ± Lenvatinib in uHCC

EMERALD-3
AZ IO TRIALS

POPULATION

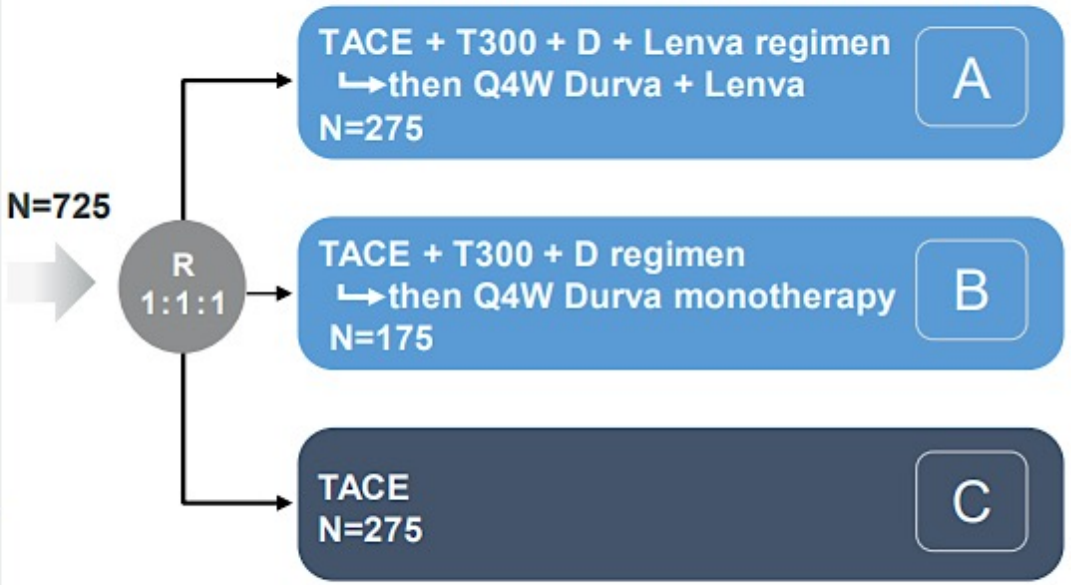
- Pathologically or radiologically confirmed HCC
- Unsuitable for curative treatment e.g. surgical resection, transplantation, ablation
- No prior systemic therapy
- No extrahepatic disease
- Child-Pugh class A
- ECOG: 0 or 1
- Exclude Vp3 and Vp4

Stratification factors

- Region (Japan vs. Asia non-Japan vs. others)
- Prior Palliative LR therapy (1>6m vs. 1≤6m vs. none))
- Baseline tumor burden (> up to 7 vs ≤ up to 7)

TREATMENT

Open label, Phase-3, multi-center study



ENDPOINTS

Primary Endpoint:
PFS (RECIST 1.1 by BICR)

Secondary Endpoint:
OS, ORR, Landmark OS, PROs, Safety

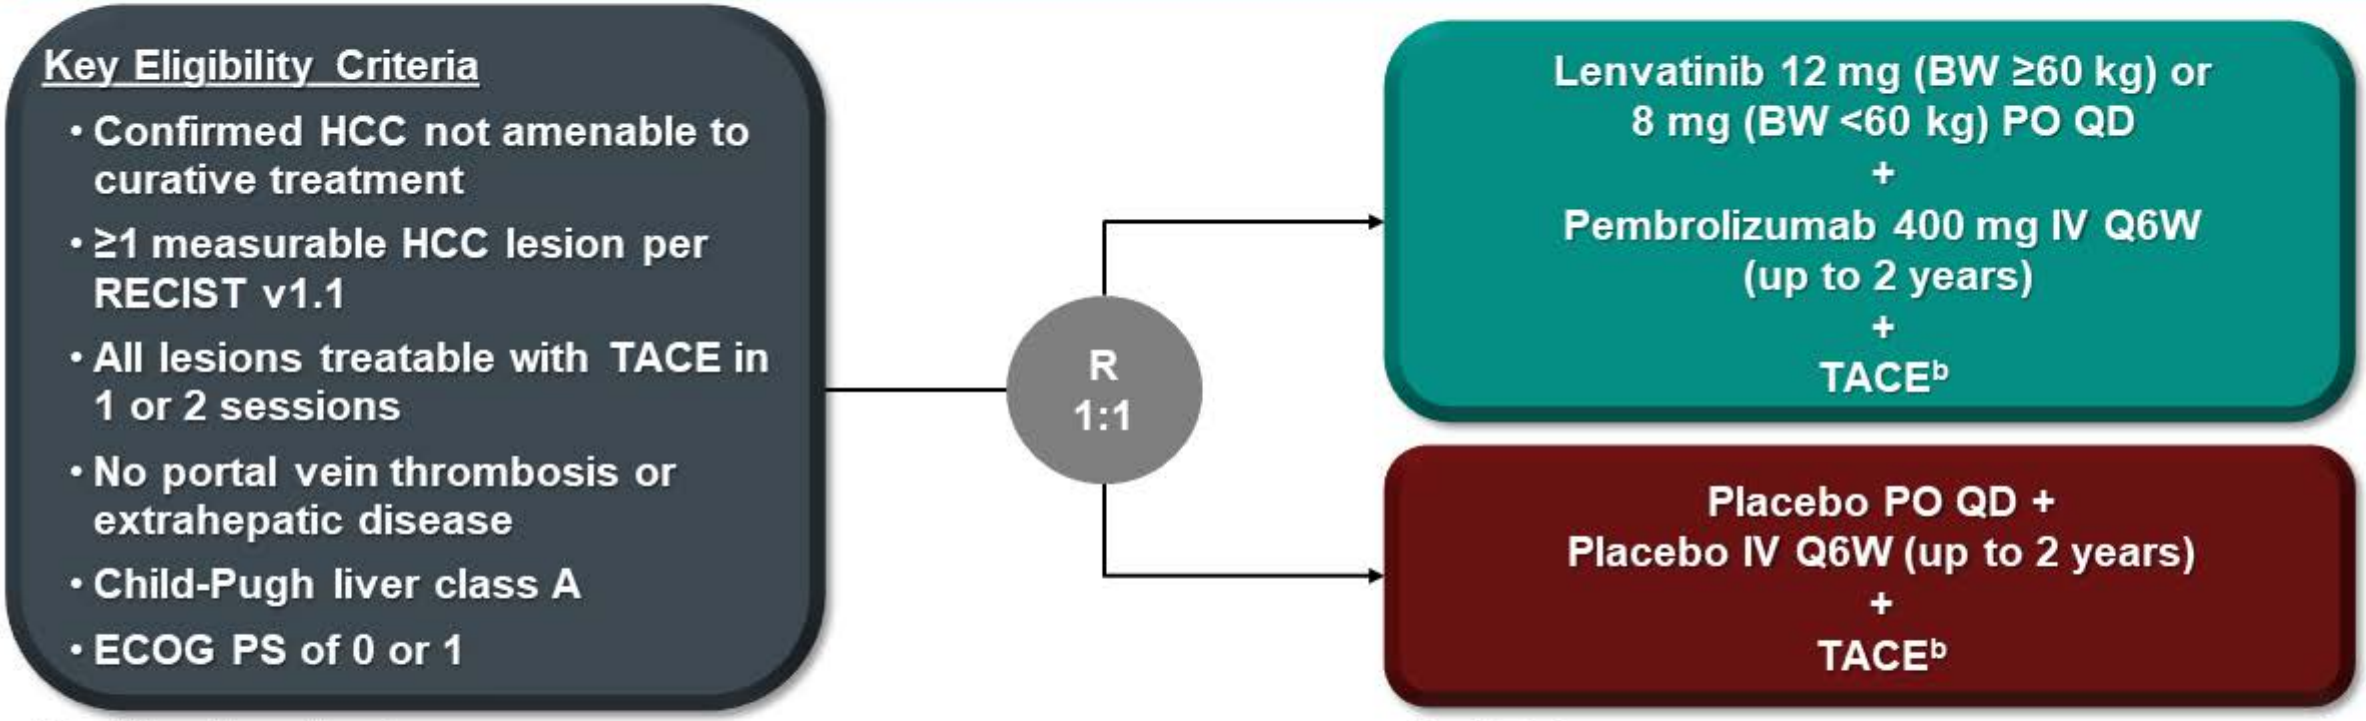
Dosing:

- Treme 300mg + Durva 1500mg IV on Cycle 1 Day 1(C1D1) for one dose
- Followed by Durva Q4W until progression
- Lenvatinib will start Day 1 (D1=first day of systemic therapy) and continue daily

TACE modalities :

- cTACE, DEB-TACE

LEAP-012 Study Design (NCT04246177)



Stratification Factors

- Study site
- Alpha fetoprotein (≤400 ng/mL vs >400 ng/mL)
- ECOG PS (0 vs 1)
- ALBI grade (1 vs 2 or 3)
- Tumor burden score[1,a] (≤6 vs >6 but ≤12 vs >12)

End Points

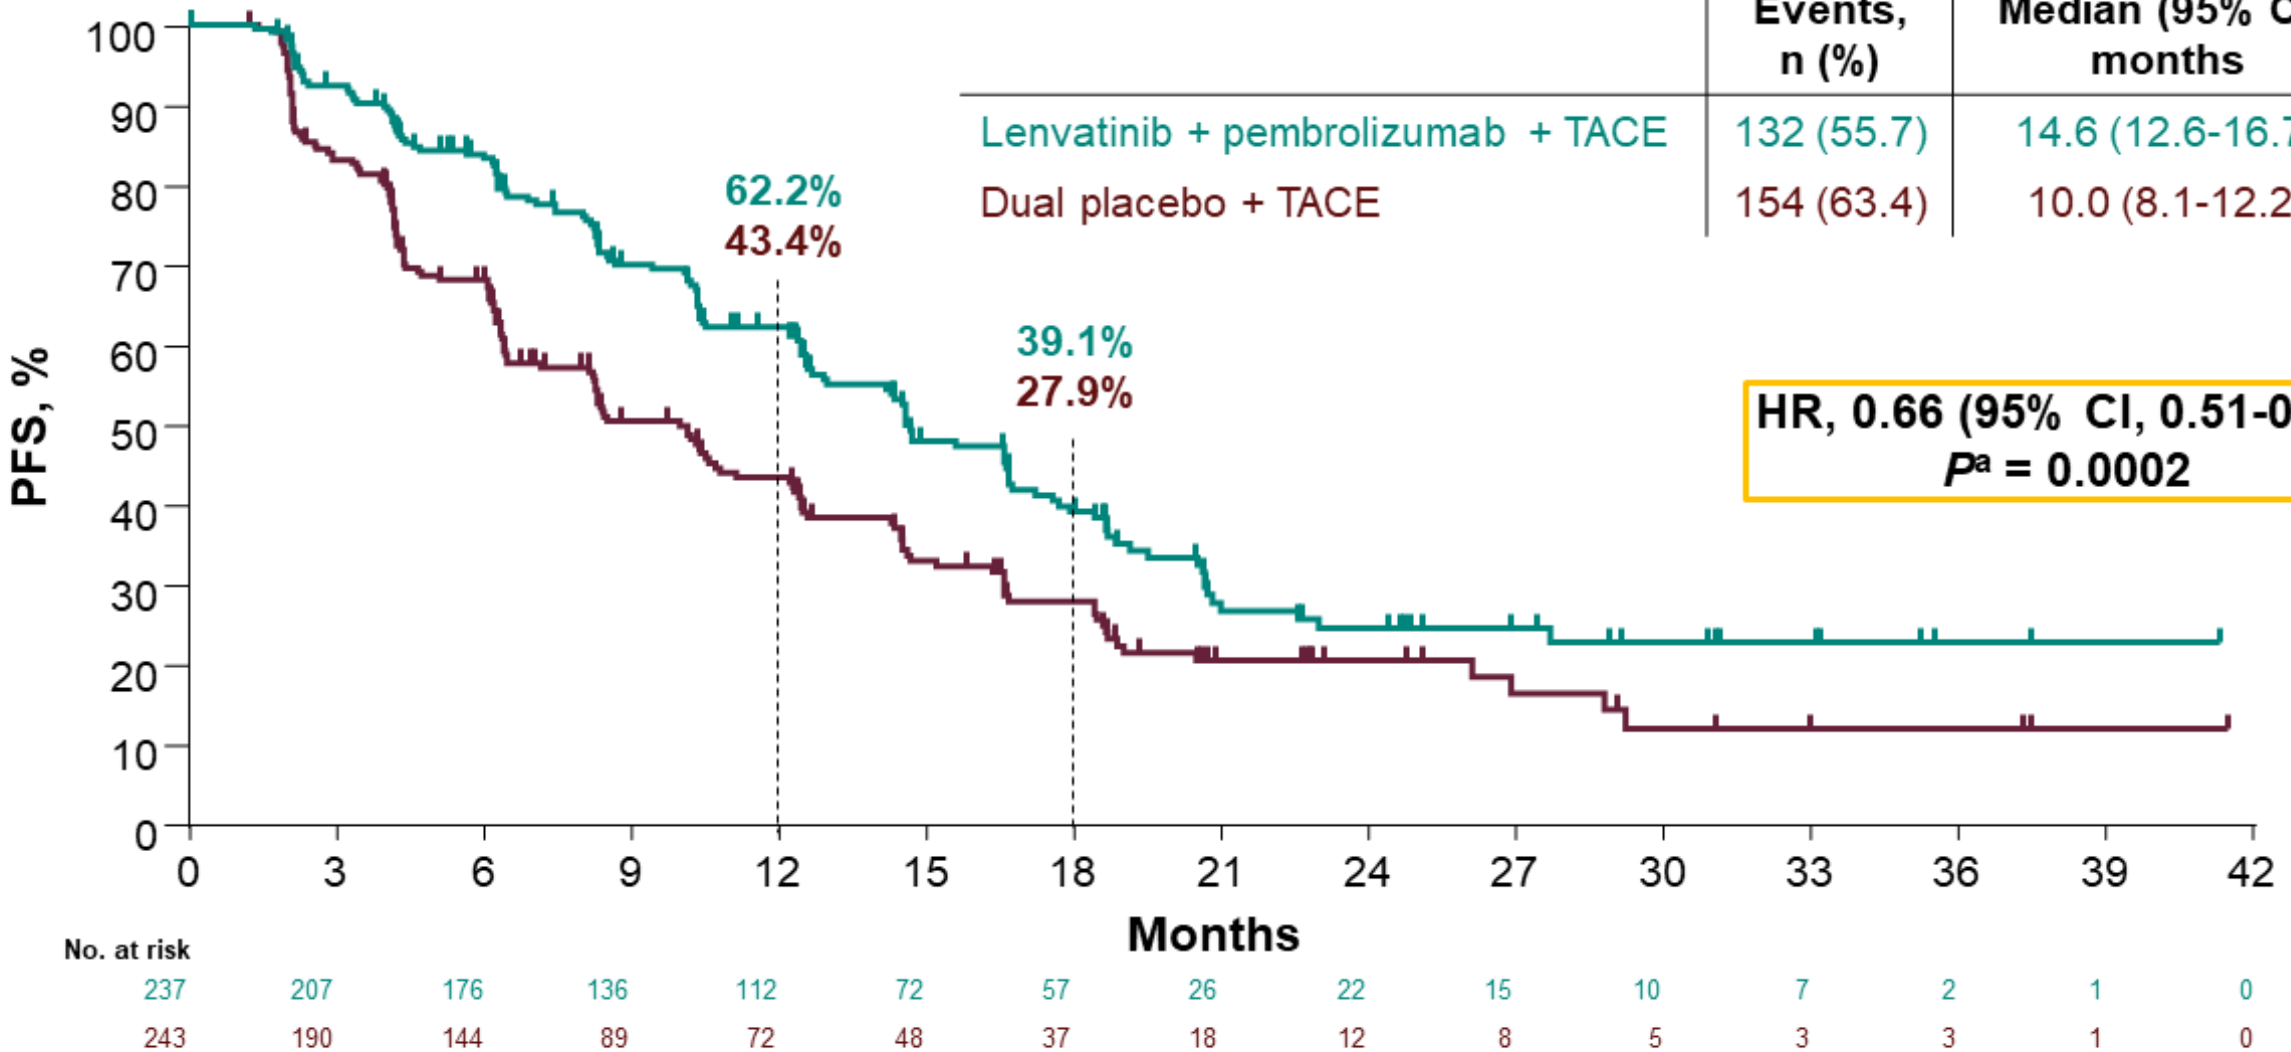
- Primary: PFS[c] and OS
  - IA1 is the **final analysis** for PFS
  - Initial alpha of 0.025 (1-sided) allocated to PFS; passed to OS if PFS is statistically significant
- Secondary: ORR,[c,d] DOR,[c,d] DCR,[c,d] TTP,[c,d] PFS,[d] and safety

1. Wang Q et al. *J Hepatol*. 2019;70:893-903.

[a]Largest tumor in centimeters + number of tumors. [b]2-4 weeks after the start of systemic therapy with a maximum of 2 treatments per tumor (4 total) and no more than 1 treatment per month. [c]Per RECIST v1.1 by BICR. [d]Per mRECIST by BICR.

Progression-Free Survival per RECIST v1.1 by BICR

	Events, n (%)	Median (95% CI), months
Lenvatinib + pembrolizumab + TACE	132 (55.7)	14.6 (12.6-16.7)
Dual placebo + TACE	154 (63.4)	10.0 (8.1-12.2)



[a]One-sided *P* from re-randomization test; threshold *P* = 0.025. Data cutoff date for IA1: January 30, 2024.

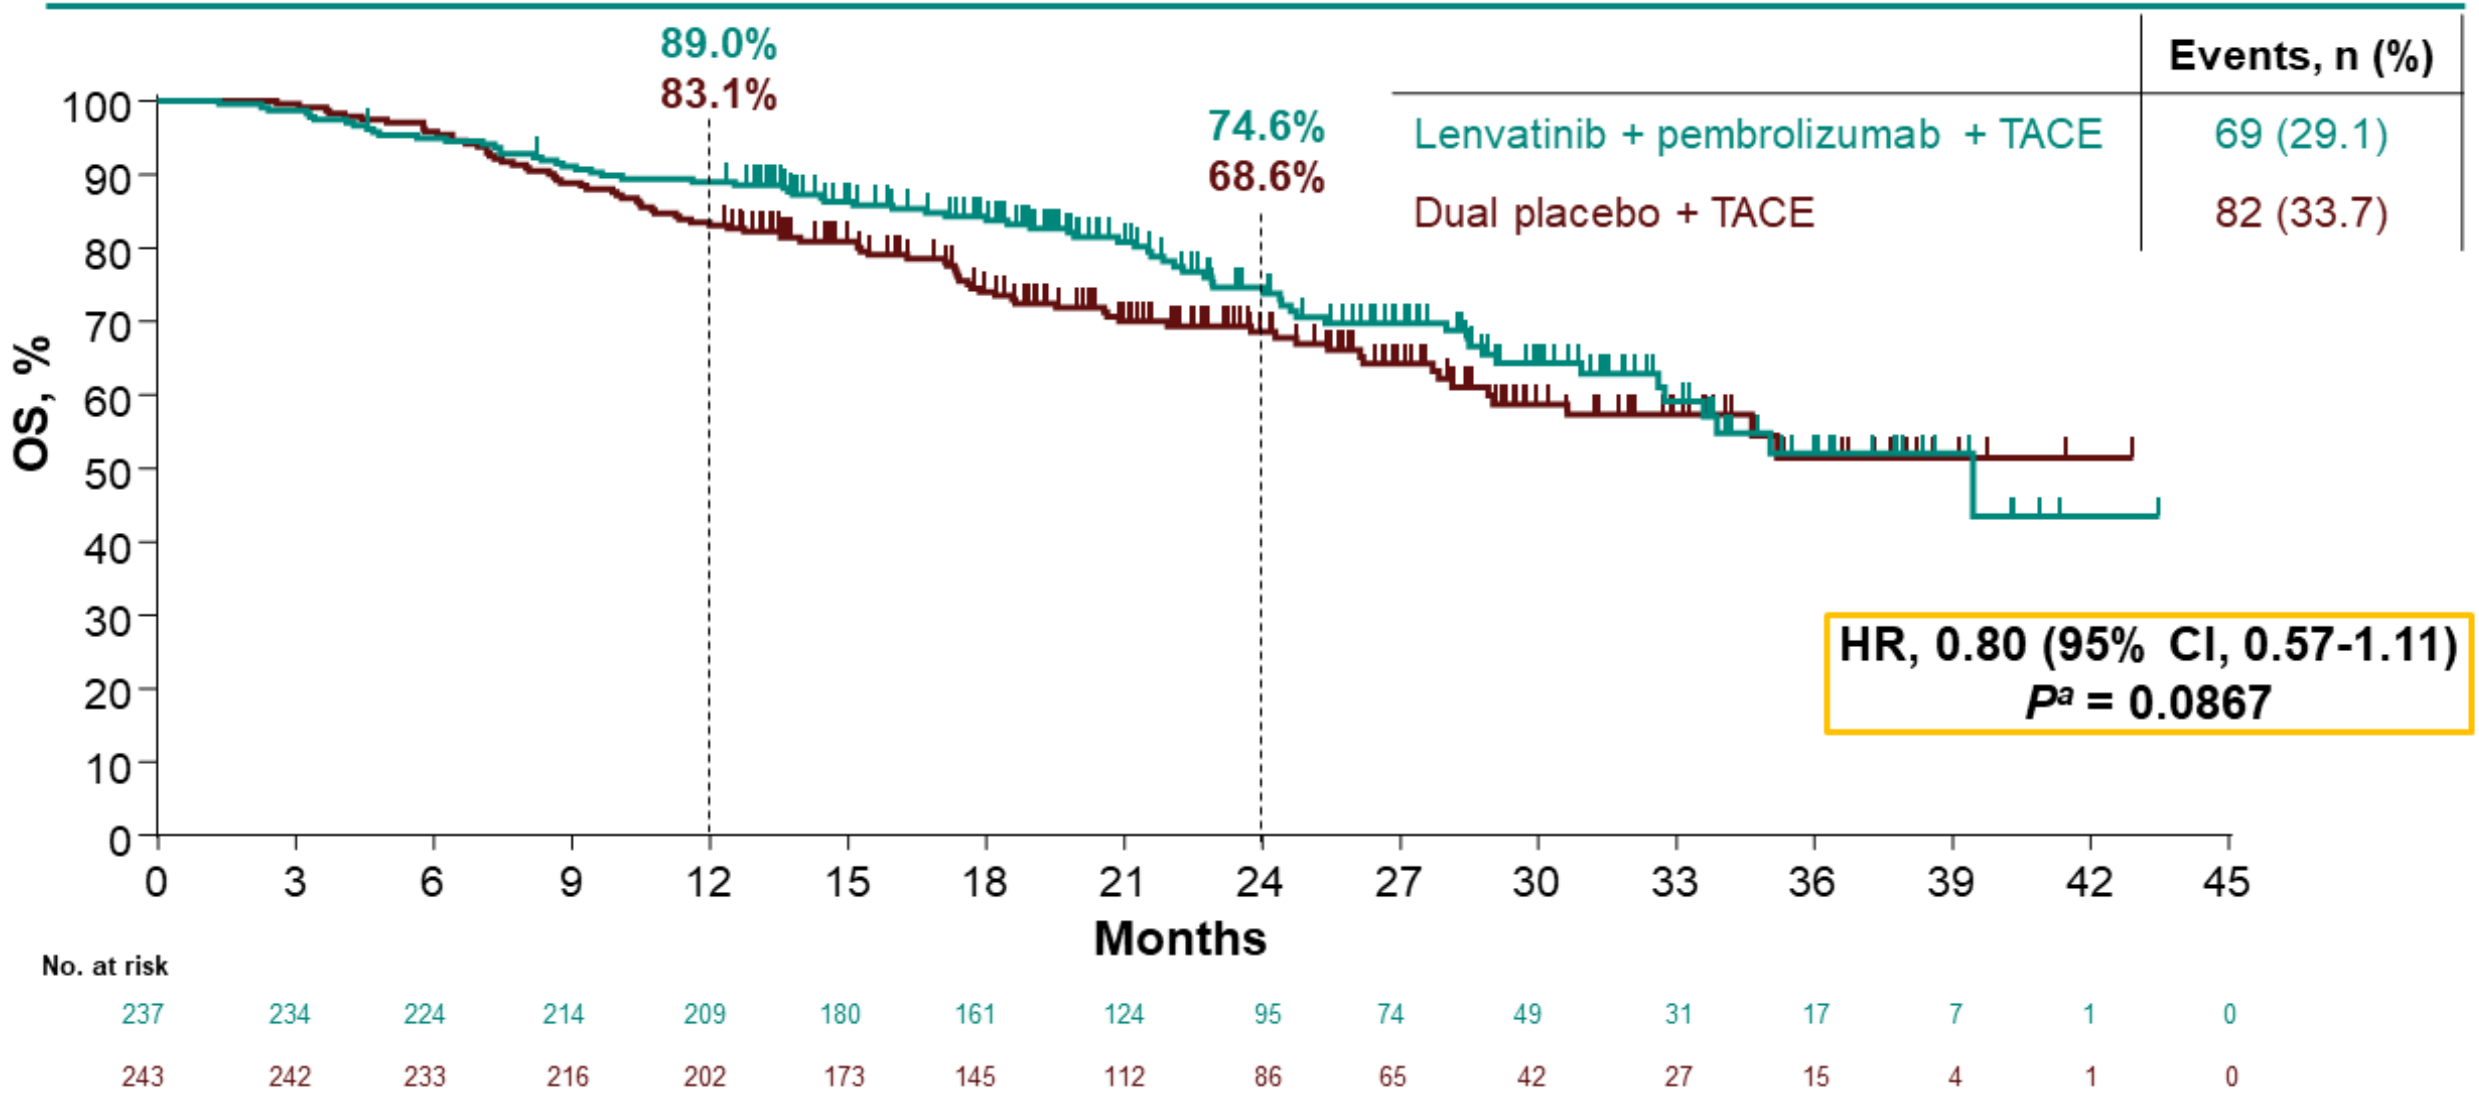
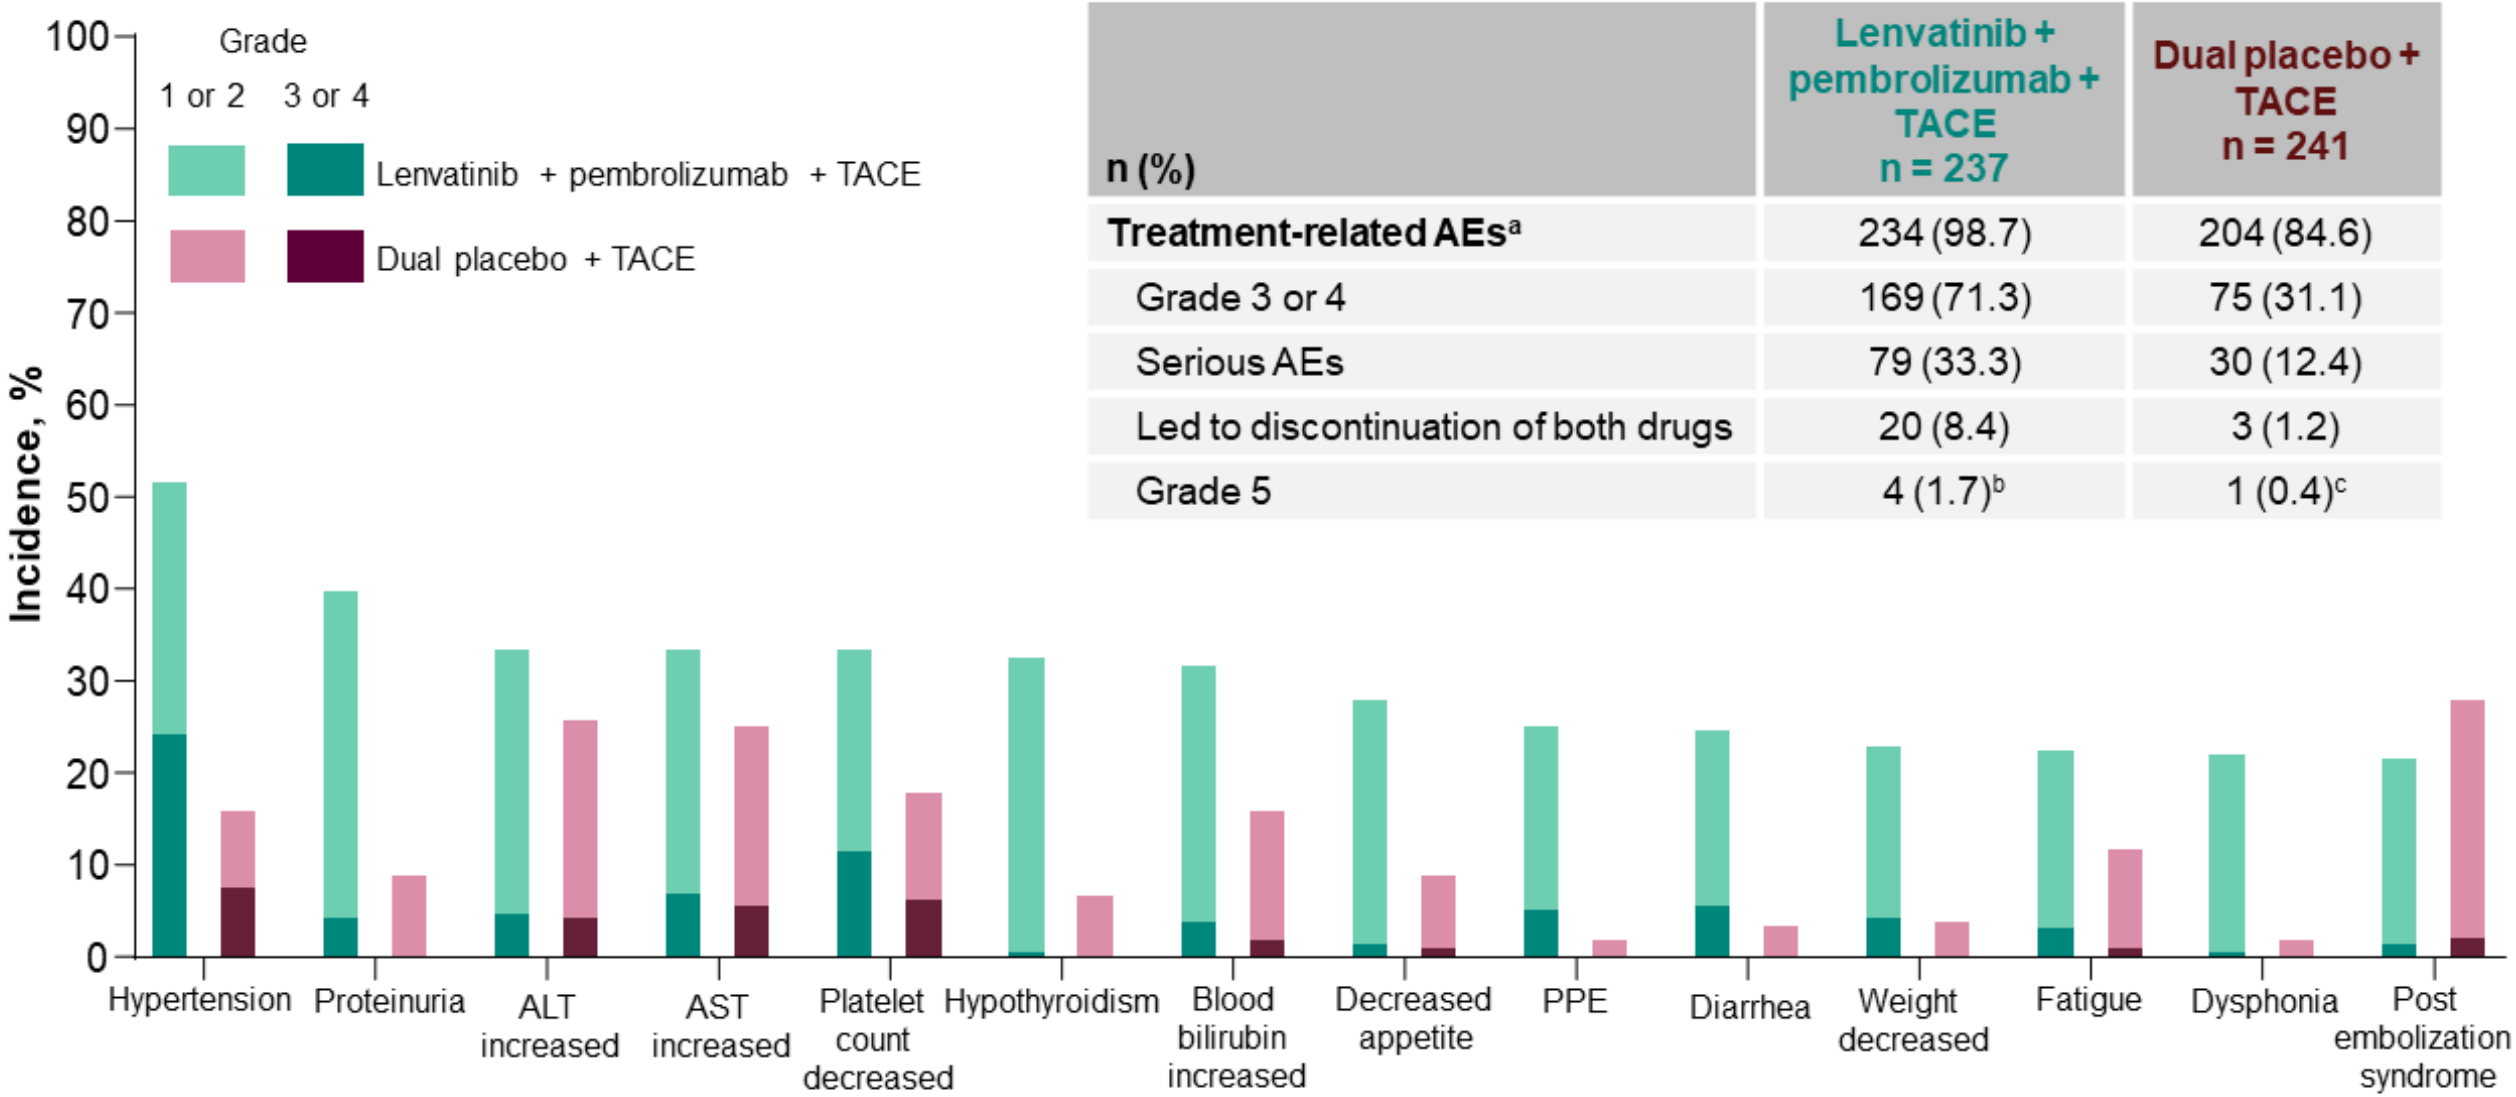
Overall Survival



[a]One-sided *P* from re-randomization test; threshold *P* = 0.0012. Data cutoff date for IA1: January 30, 2024.

Kudo M, Ren Z, Guo Y, et al. *Lancet*. 2025;405(10474):203-215.

Most Common Treatment-Related Adverse Events[a] (≥25%)



n (%)	Lenvatinib + pembrolizumab + TACE n = 237	Dual placebo + TACE n = 241
Treatment-related AEs[a]	234 (98.7)	204 (84.6)
Grade 3 or 4	169 (71.3)	75 (31.1)
Serious AEs	79 (33.3)	30 (12.4)
Led to discontinuation of both drugs	20 (8.4)	3 (1.2)
Grade 5	4 (1.7)[b]	1 (0.4)[c]

[a]Related to pembrolizumab, lenvatinib, and/or TACE. [b]1 patient each died from hepatic failure, gastrointestinal hemorrhage, myositis, and immune-mediated hepatitis. [c]1 patient died from brain stem hemorrhage. Data cutoff date for IA1: January 30, 2024. Kudo M, Ren Z, Guo Y, et al. *Lancet*. 2025;405(10474):203-215.

Answer:

Combining Local and Systemic Immunotherapies carry the promise of controlling hepatic tumors, delaying liver failure and potentially improving OS

However, OS benefit is still lacking/under investigation
And
Large randomized clinical trials are needed ..

Educational Objectives

- Updated data of adjuvant treatment for early-stage HCC at high risk of recurrence following surgery or ablation
- The changing landscape in combining TACE and systemic therapies in patients with unresectable HCC eligible for embolization
- **Conclusion**

Conclusions

- Recent advances in IO therapy in HCC in intermediate/advanced HCC are being translated into higher response rates and improved progression-free survival → However, IO tx remains palliative and predictive biomarkers are needed to identify candidates for curative tx

- New therapeutic targets to lower IO resistance are emerging and expected to improve curative rates. Dual CPI and cancer vaccines seem to lower resistance to IO.

- Integrating Immunotherapy into early-stage (operable) HCC requires an understanding of Benefit-Risk ratio, TME, and specific regimens MOA to address resistance to IO.

- Notably, designing future trials should be customized based on disease etiology, underlying liver disease, and tumor characteristics and requires global participation to address disparity in healthcare/trials access

Discussion Question

- A 75-year-old man with a history of hepatitis C is diagnosed with HCC with a Child-Pugh A score and a total of 5 lesions in both lobes of the liver. The lesions are amenable to TACE. Regulatory and reimbursement issues aside, which therapy would you most likely recommend?

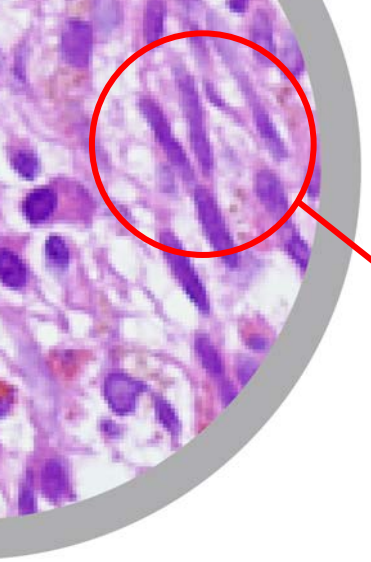
WHO Diagnostic Criteria for Systemic Mastocytosis

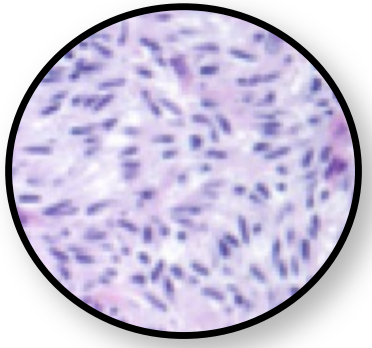


Major
- Mast cell aggregates (≥ 15) in the marrow or other extracutaneous tissue

Minor
- Spindle-shaped mast cells
- *KIT* D816V or other activating *KIT* mutation
- CD2 +/- CD25 expression on mast cells
- Serum tryptase > 20 ng/mL

Diagnosis requires:
1 major + 1 minor or ≥ 3 minor criteria)[1]

~65%



Indolent SM (ISM)

0 or 1 B-findings

Smoldering SM (SSM)

2 or more B-findings

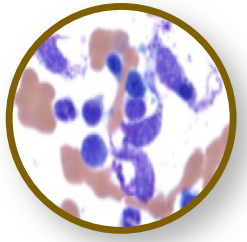
Advanced SM

~10%

Aggressive SM (ASM)

≥1 or more C-findings

~25%



SM with an Associated Hematologic Neoplasm (SM-AHN)

1%

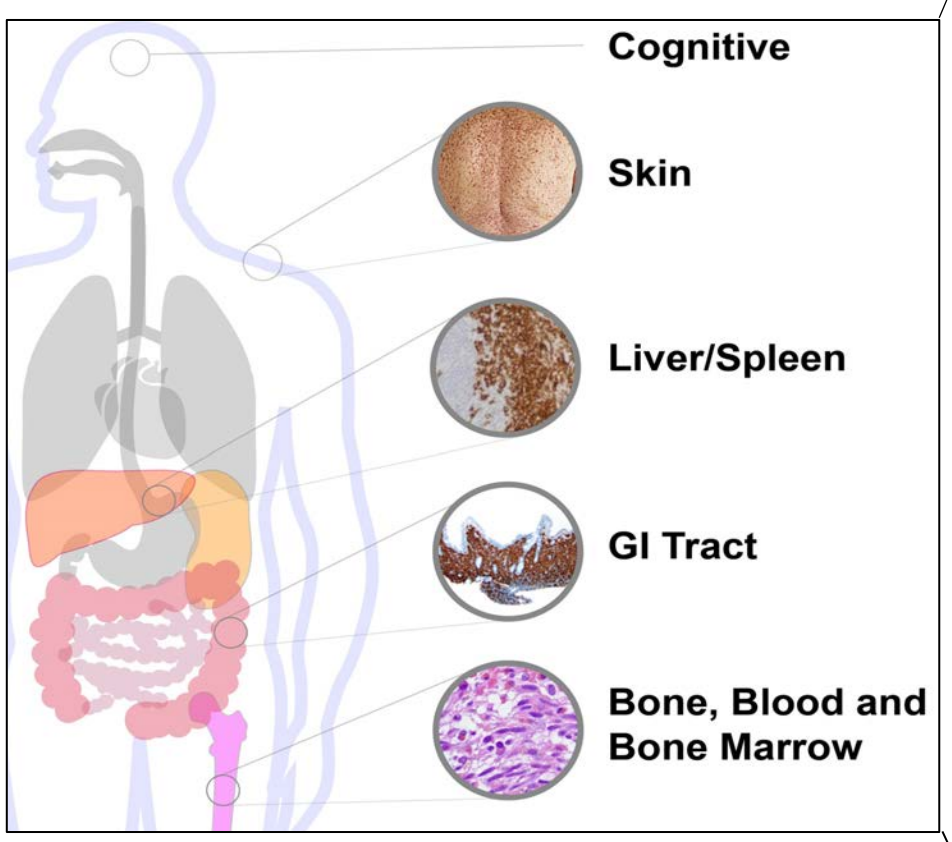
Mast Cell Leukemia (MCL)

≥20% mast cells on BM aspirate

[1]Horny H-P, *et al*, WHO Classification, 2017

Slide courtesy of Jason Gotlib

Heterogeneous extent and severity of SM-related organ involvement: B- and C-Findings



Neoplastic mast cells are not equal opportunity organ offenders

e.g. low marrow burden but severe liver disease in the same patient

'B Findings' (Higher Burden Disease)

1. BM: ≥30% mast cells and/or tryptase level ≥200 ng/ml and/or *KIT* D816V VAF ≥10% in BM or PB leukocytes
2. Hepatomegaly or splenomegaly without liver dysfunction or hypersplenism; or lymphadenopathy (> 2cm on CT or US)
3. Signs of dysplasia or myeloproliferation, without a frank AHN; normal or mildly abnormal blood counts

'C Findings' (Organ Damage) (Need for Cytoreduction)

1. Cytopenias (ANC <1/Hgb <10/plts <100) due to BM infiltration
2. Ascites and elevated liver enzymes ± hepatomegaly or cirrhotic liver ± portal hypertension
3. Large-sized osteolysis (≥2 cm) with pathologic fracture ± bone pain
4. Palpable splenomegaly with hypersplenism ± weight loss ± hypoalbuminemia
5. Malabsorption with hypoalbuminemia ± weight loss

ISM

0 or 1 B-finding

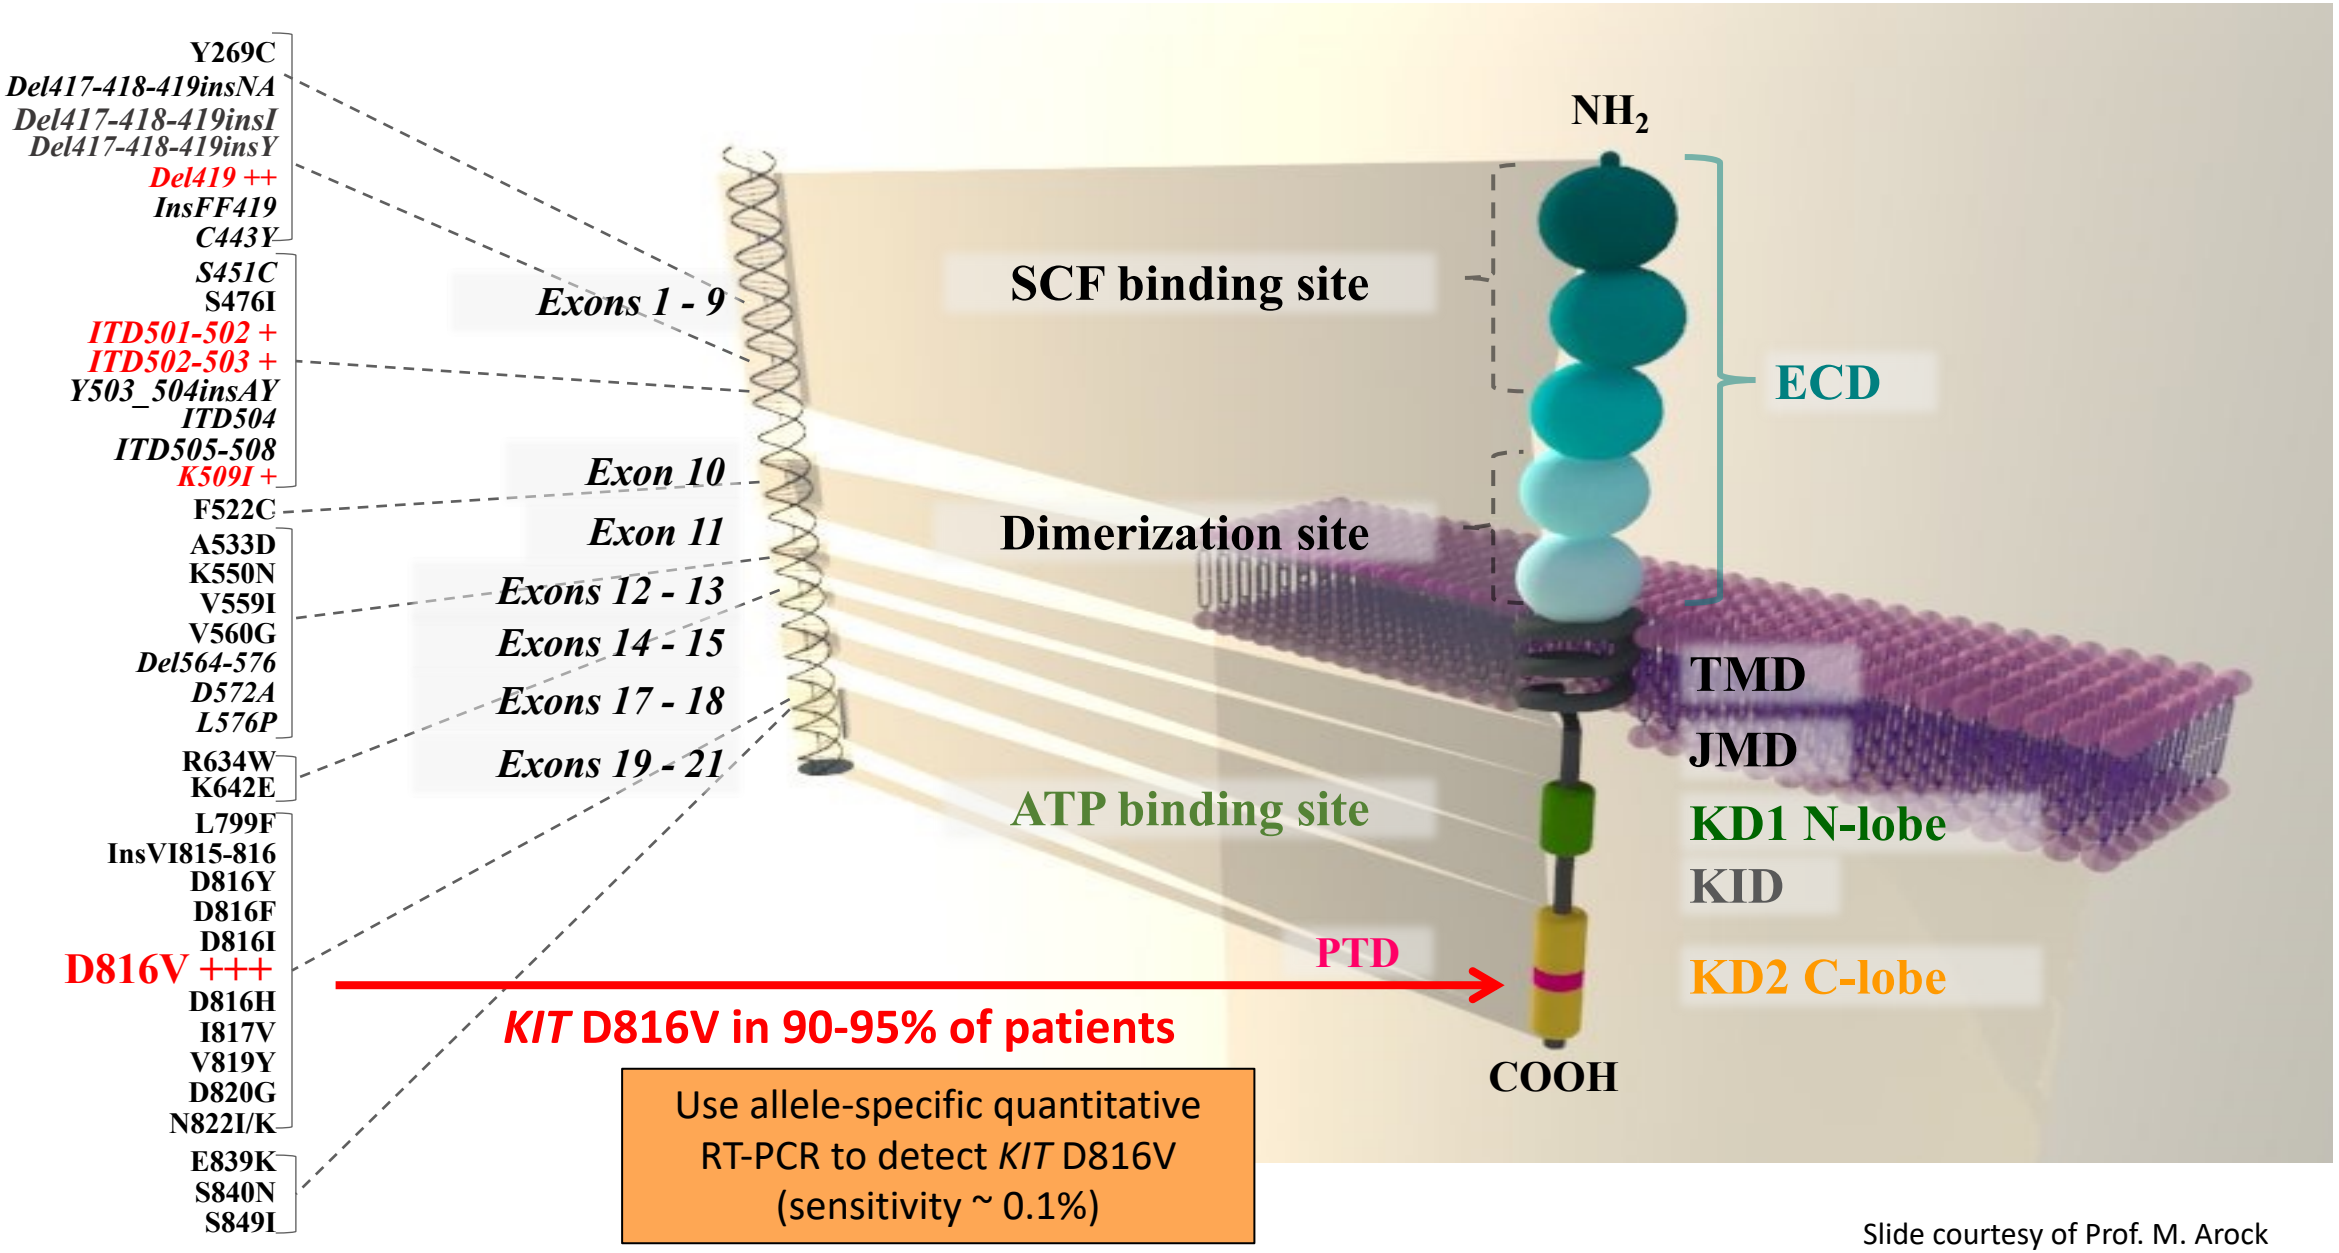
SSM

≥ 2 B-findings

ASM

≥1 C-findings

KIT Mutations are Found in the Vast Majority of SM Patients



Use allele-specific quantitative RT-PCR to detect *KIT* D816V (sensitivity ~ 0.1%)

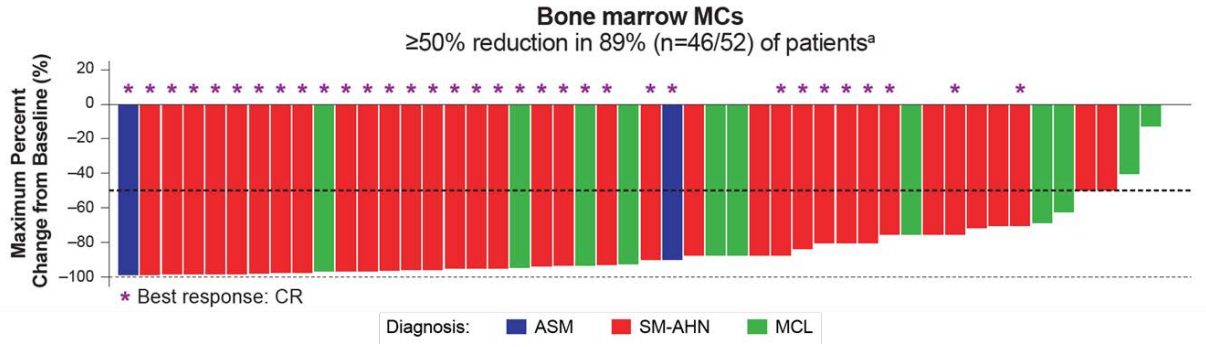
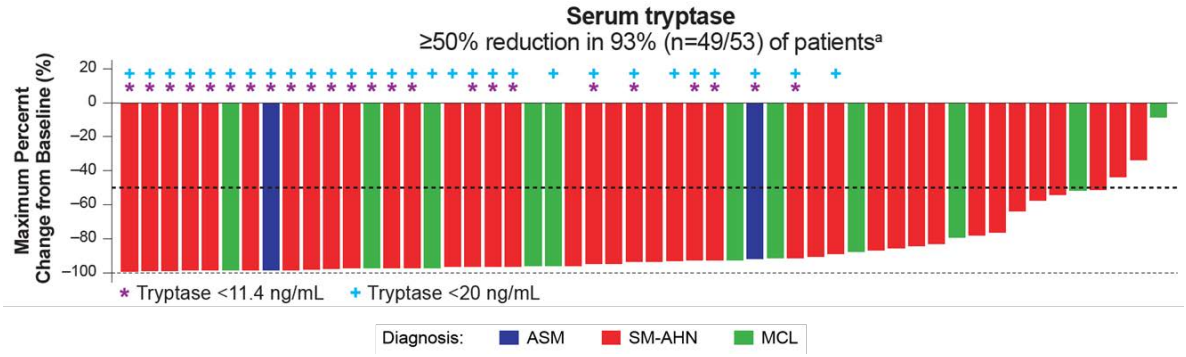
Data cut-off date: September 15, 2023. Median (range) follow-up was 38 months (95% CI; 35.5–42.0). [a]Includes subset with no AHN (n=11) and subset with AHN (n=4). Per WHO classification, the diagnostic criteria for subtyping MCL includes BM aspirate smears ≥20% (regardless of the presence of AHN).

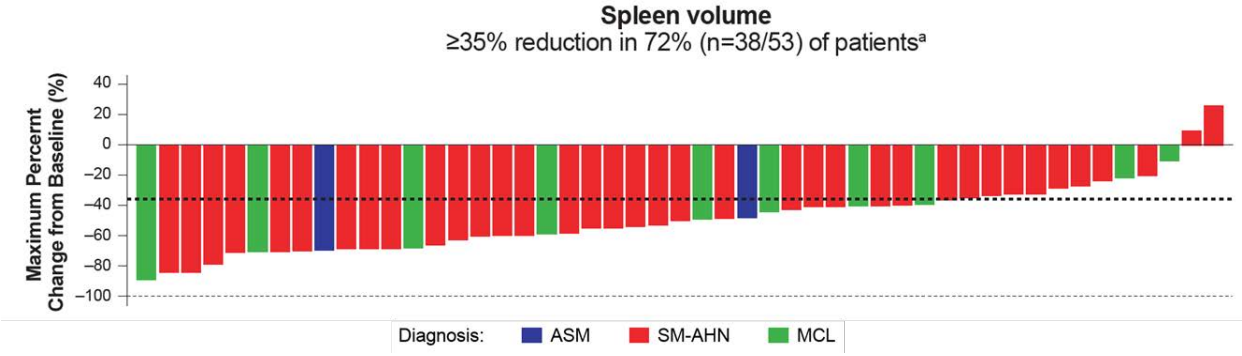
Reiter A et al. EHA 2024;Abstract S224

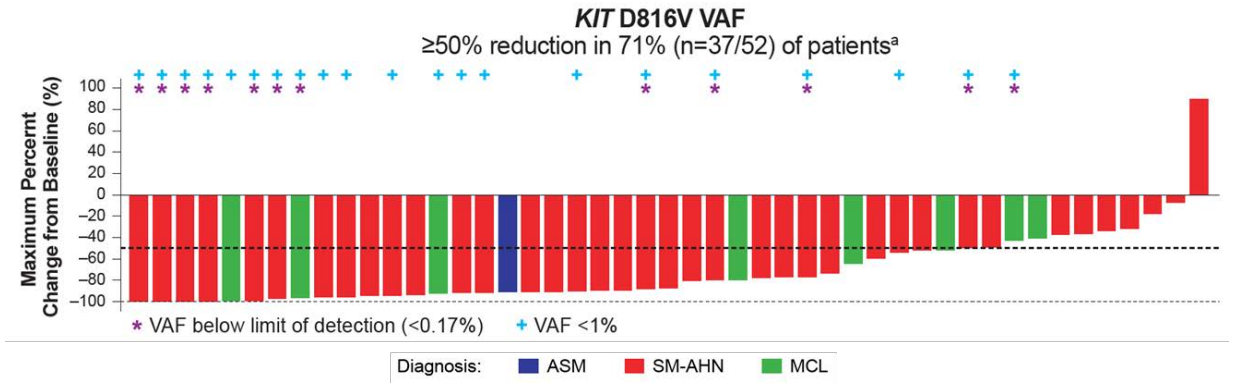
Reduction in measures of mast cell burden: pooled data from EXPLORER / PATHFINDER

(Response-evaluable population)









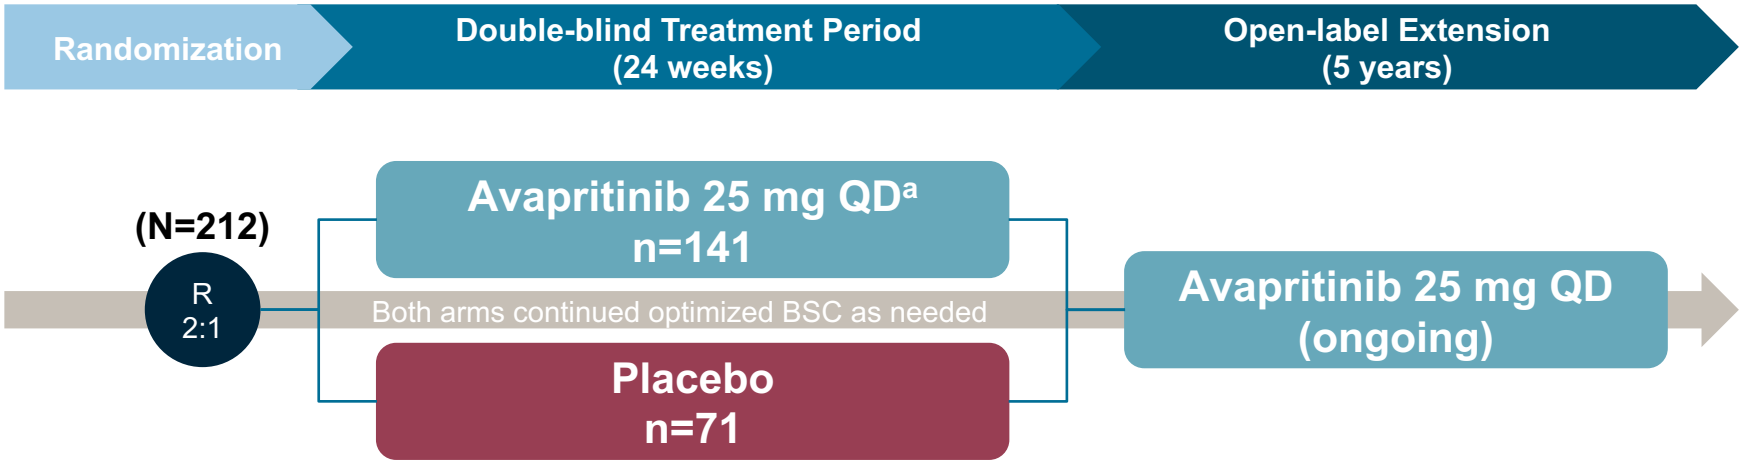
Data cut-off date of May 27, 2020, for EXPLORER and June 23, 2020, for PATHFINDER. [a]Calculation includes patients without post-baseline assessments who were excluded from the waterfall plot. VAF, variant allele fraction.

Reiter A et al. Blood Adv. 2022 Jun 2;6(21):5750–5762.

Registrational PIONEER study: randomized, double-blind, placebo-controlled study in patients with ISM

Screening Period

- Best supportive care medications (BSC) optimized for 2–3 months
  - Antihistamines, cromolyn, anti-IgE antibody, leukotriene inhibitors, corticosteroids, etc.
- Eligibility
  - Age ≥18 years
  - ISM confirmed by central pathology review
  - Uncontrolled moderate-to-severe (TSS ≥28) symptoms after at least 2 BSC medications



Symptoms

- Mean change in ISM-SAF Total Symptom Score (TSS) from baseline to Week 24 (primary endpoint)
- Mean change in individual symptom scores of ISM-SAF
- Mean change in most severe symptom score

Biomarkers of Mast Cell Burden

- ≥50% reduction in serum tryptase levels
- ≥50% reduction in KIT D816V VAF in peripheral blood (or below level of detection [<0.02%] for patients with a detectable mutation at baseline)
- ≥50% reduction in in bone marrow mast cell aggregates

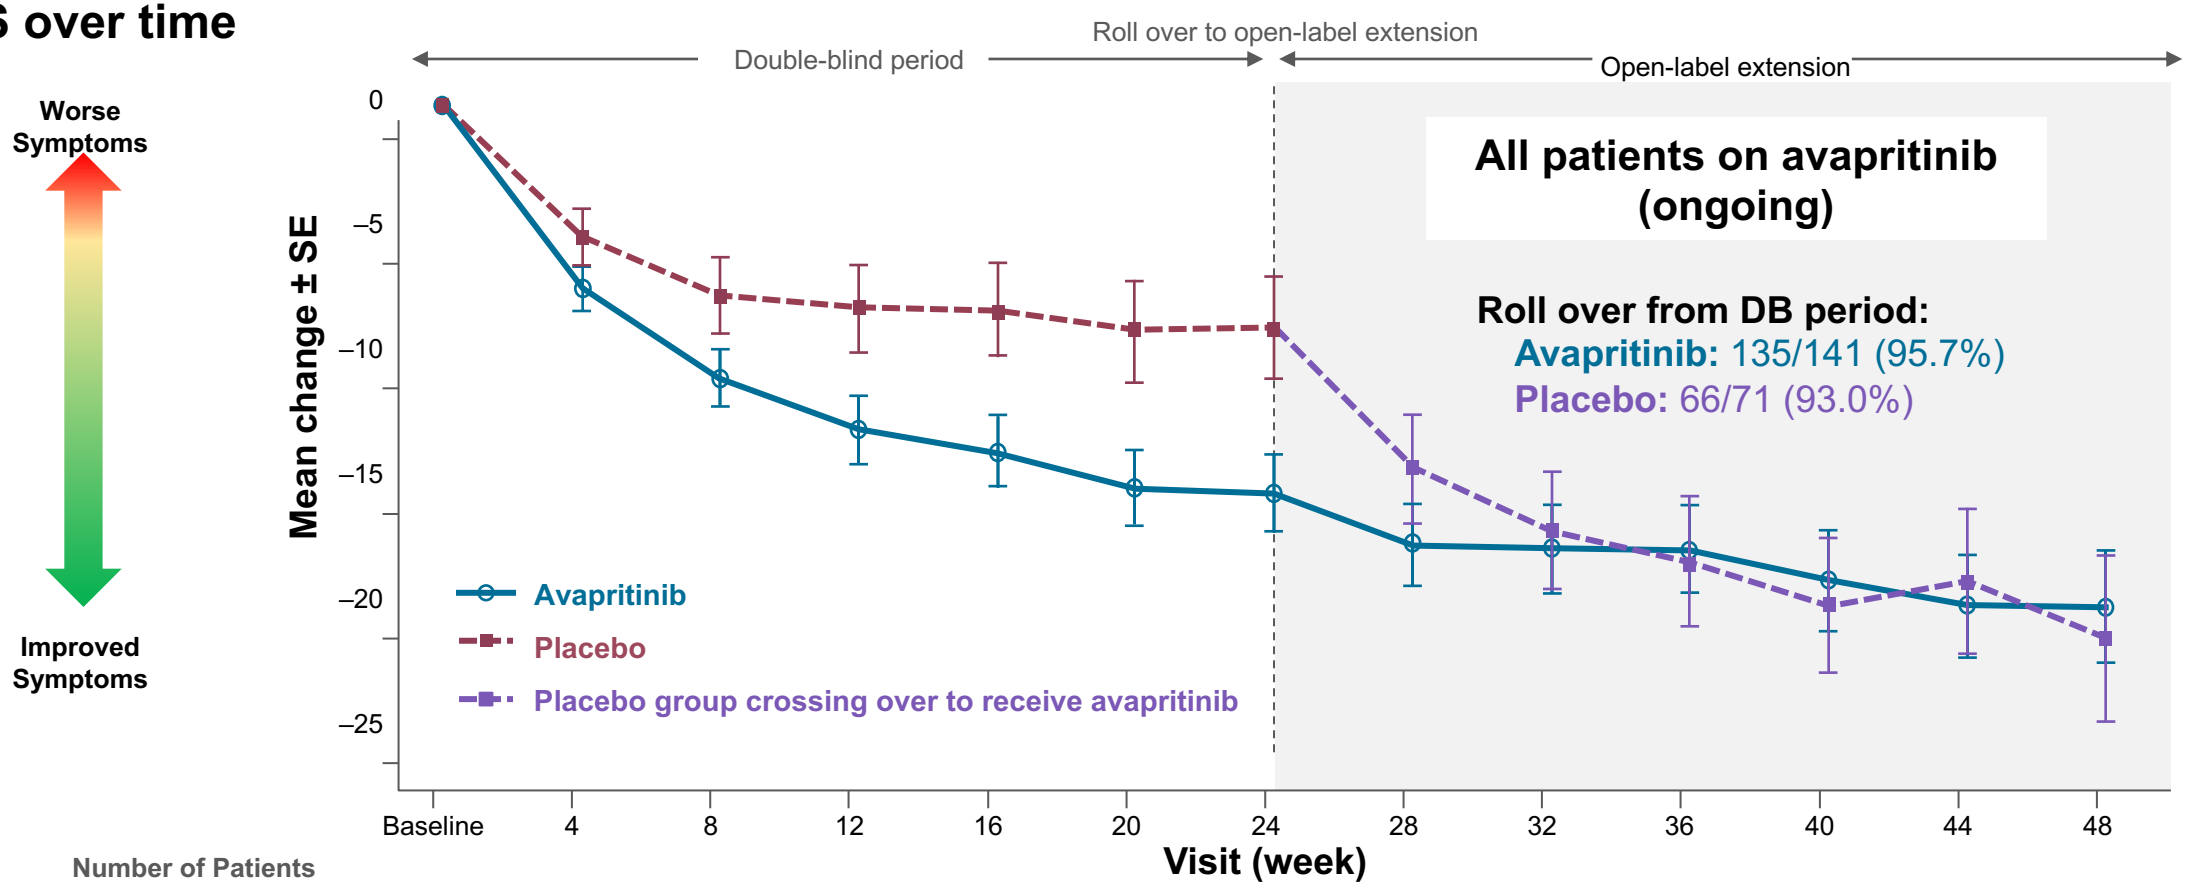
Quality of Life

- Mean % change in QoL score, as measured by MC-QoL

[a]The recommended dose of avapritinib for Part 2 and Part 3 was identified based on efficacy and safety results from Part 1 that included 4 cohorts: 25 mg avapritinib (n=10), 50 mg avapritinib (n=10), 100 mg avapritinib (n=10) and placebo (n=9). Patients treated with high dose steroids within 7 days of primary endpoint (n=4) were excluded from the week 24 analysis, but included at other timepoints of the study.
Percentages were calculated based on available data at the timepoint. One-sided *P*-values are reported for primary and key secondary endpoints.
ISM-SAF, Indolent Systemic Mastocytosis-Symptom Assessment Form; QD, once-daily. QoL, quality of life; R, randomized; VAF, variant allele fraction.

Avapritinib demonstrated significant and durable improvement in symptoms versus placebo

TSS over time



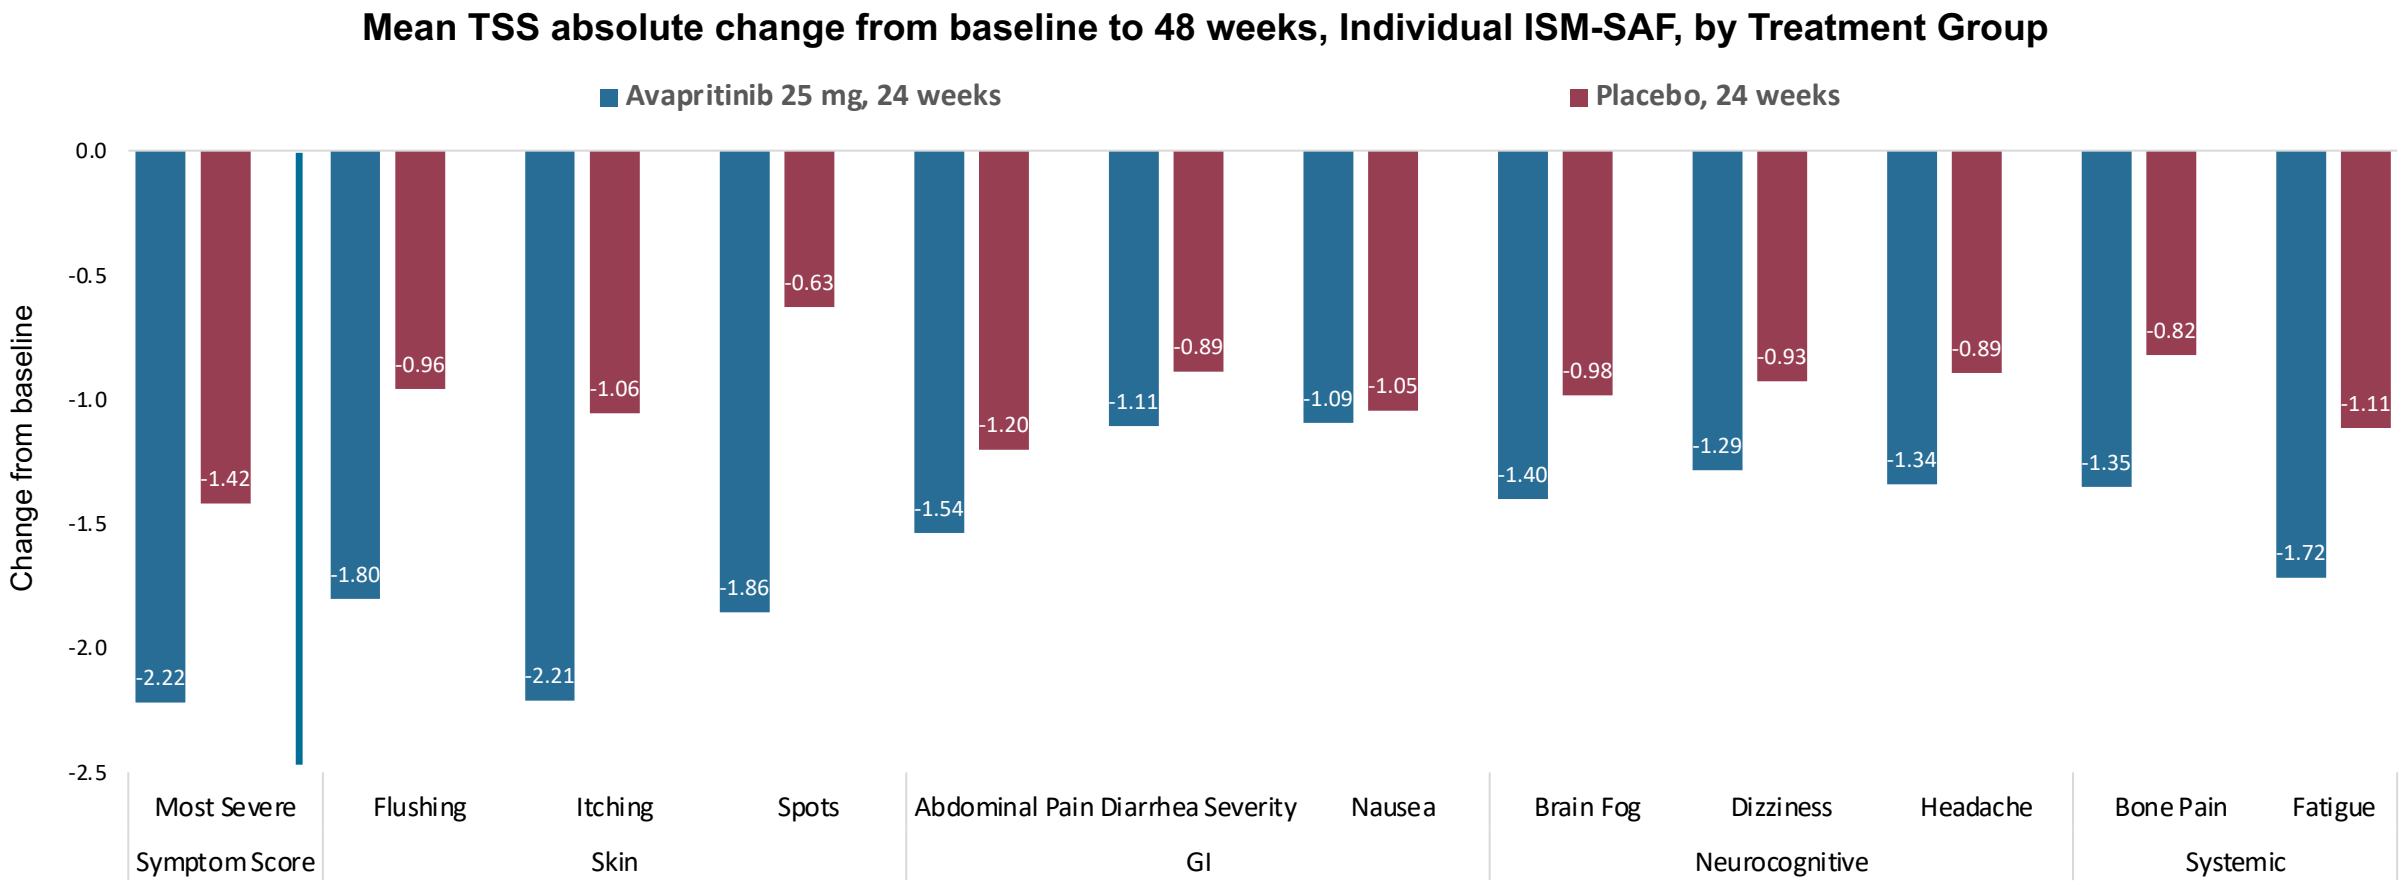
Number of Patients	Baseline	4	8	12	16	20	24	28	32	36	40	44	48
Avapritinib	139	137	135	135	137	136	133	123	106	91	76	70	60
Placebo	71	71	71	68	67	66	66	60	51	41	39	33	26

At Week 24	Avapritinib 25 mg (N=141)	Placebo (N=71)	P-value
Mean change in TSS (95% CI)	-15.58 (-18.61, -12.55)	-9.15 (-13.12, -5.18)	0.003

A one-sided P-value of <0.025 was needed to declare avapritinib as superior in reducing TSS versus placebo.
DB, double-blind.

Gotlib J et al. NEJM Evid 2023

Avapritinib demonstrated improvement in all individual ISM symptoms versus placebo including the most severe symptom at baseline



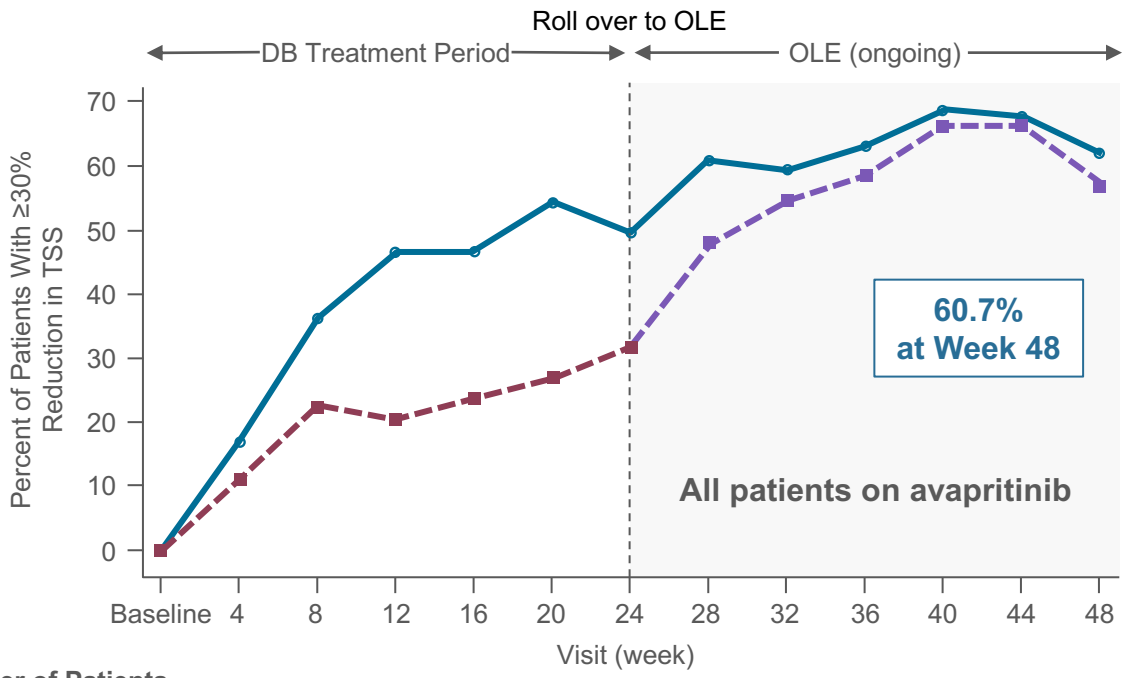
Mean Change in Most Severe Symptom Score (SD)	Avapritinib 25 mg (n=128)	Placebo (n=65)	P-Value
	-2.22 (2.302)	-1.42 (1.875)	0.015

Regardless of which symptom was rated most severe at baseline, avapritinib patients had a significant reduction in this symptom versus placebo

Gotlib J et al. NEJM Evid 2023

Avapritinib-treated patients were significantly more likely than placebo to reach the TSS ≥30% and TSS ≥50% thresholds over time

≥30% reduction in ISM-SAF TSS score over time



Number of Patients

Avapritinib + BSC	139	135	133	133	135	134	131	121	104	89	74	69	58

Placebo + BSC	63	57	54	52	51	53	54

At Week 24	Avapritinib 25 mg (N=141)	Placebo (N=71)	P-value
Proportion of patients with **≥50% reduction in serum tryptase** (95% CI)	53.9% (45.3, 62.3)	0.0% (0.0, 5.1)	<0.0001

At Week 24	Avapritinib 25 mg (N=141)	Placebo (N=71)	P-value
Proportion of patients with **≥50% reduction in *KIT* D816V VAF** (95% CI)	67.8% (58.6, 76.1)	6.3% (1.8, 15.5)	<0.0001

At Week 24	Avapritinib 25 mg (N=141)	Placebo (N=71)	P-value
Proportion of patients with **≥50% reduction in BM MC aggregates** (95% CI)	52.8% (42.9, 62.6)	22.8% (12.7, 35.8)	<0.0001

BM, bone marrow; BSC, best supportive care; CI, confidence interval; MC, mast cell; QD, once-daily; VAF, variant allele fraction.

Gotlib J et al. NEJM Evid 2023

Bezuclastinib potently and selectively inhibits KIT-D816V[1]

- Oral, selective, and type I tyrosine kinase inhibitor (TKI) with potent activity against *KIT* D816V, an activation loop mutation[1]
- In non-clinical models, spares closely related kinases, has minimal brain penetration, and favorable PK properties[1]
- Inhibition of closely related kinases have been linked to off-target toxicities, such as bleeding, edema, and pleural effusions[1]

Kinase inhibition profile of clinical stage and approved *KIT*–D816V agents; Cell IC_{50} (nm)

Compound	KIT V560G/D816V (HMC 1.2)	WT KIT	PDGFRα	PDGFRβ	CSF1R	FLT3	KDR
Bezuclastinib	**14**	**121**	**>10,000**	**>10,000**	**>10,000**	**>1000**	**>1000**
Avapritinib	13	114	53	10	249	305	>1000
Elenestinib	6	355	21	6	161	345	>1000

Higher IC50 numbers indicate lower levels of activity against other off-target kinases, limiting associated toxicities, e.g. edema, hypertension, and pleural effusion

Apex (NCT04996875): A Phase 2 Open-Label, Multicenter Clinical Study of Bezuclastinib in Patients with Advanced Systemic Mastocytosis

FOCUS OF PRESENTATION

PART 1: DOSE OPTIMIZATION
ORIGINAL FORMULATION

- 50 mg BID
- 100 mg BID
- 200 mg BID
- 400 mg QD

PART 2
OPTIMIZED FORMULATION[a]

STAGE 1
DOSE CONFIRMATION

- 150mg QD
- 300 mg QD

Selected Exposure/Dose: 150mg QD

STAGE 2
EXPANSION

~55 patients with measurable C-findings per mIWG-MRT-ECNM

PART 2: ADDITIONAL COHORTS

- ~15 patients without measurable C-findings per mIWG-MRT-ECNM
- ~20 high-risk AHN patients w/concurrent azacitidine or hydroxyurea

Mean (CV%) Steady-State (Cycle 2 Day 1) Exposures

Study Part (Formulation)	Part 1 (Original Formulation)	Part 2 Stage 1 (Optimized Formulation[a])
Bezuclastinib Dose	100 mg BID (N=7)	150 mg QD (N=10)
$C_{max, ss}$ (ng/mL)	861 (26.8)	850 (29.9)
$AUC_{0-24hr,ss}$ (ng*hr/mL)	18,900 (30.8)	17,600 (31.3)

150 mg QD of the optimized formulation delivers similar exposures to 100 mg BID of original formulation

[a]The original formulation was modified to improve bioavailability.

DeAngelo DJ, et al. American Society of Hematology (ASH) 2024; San Diego, CA, 8 Dec 2024: Publication Number: 659

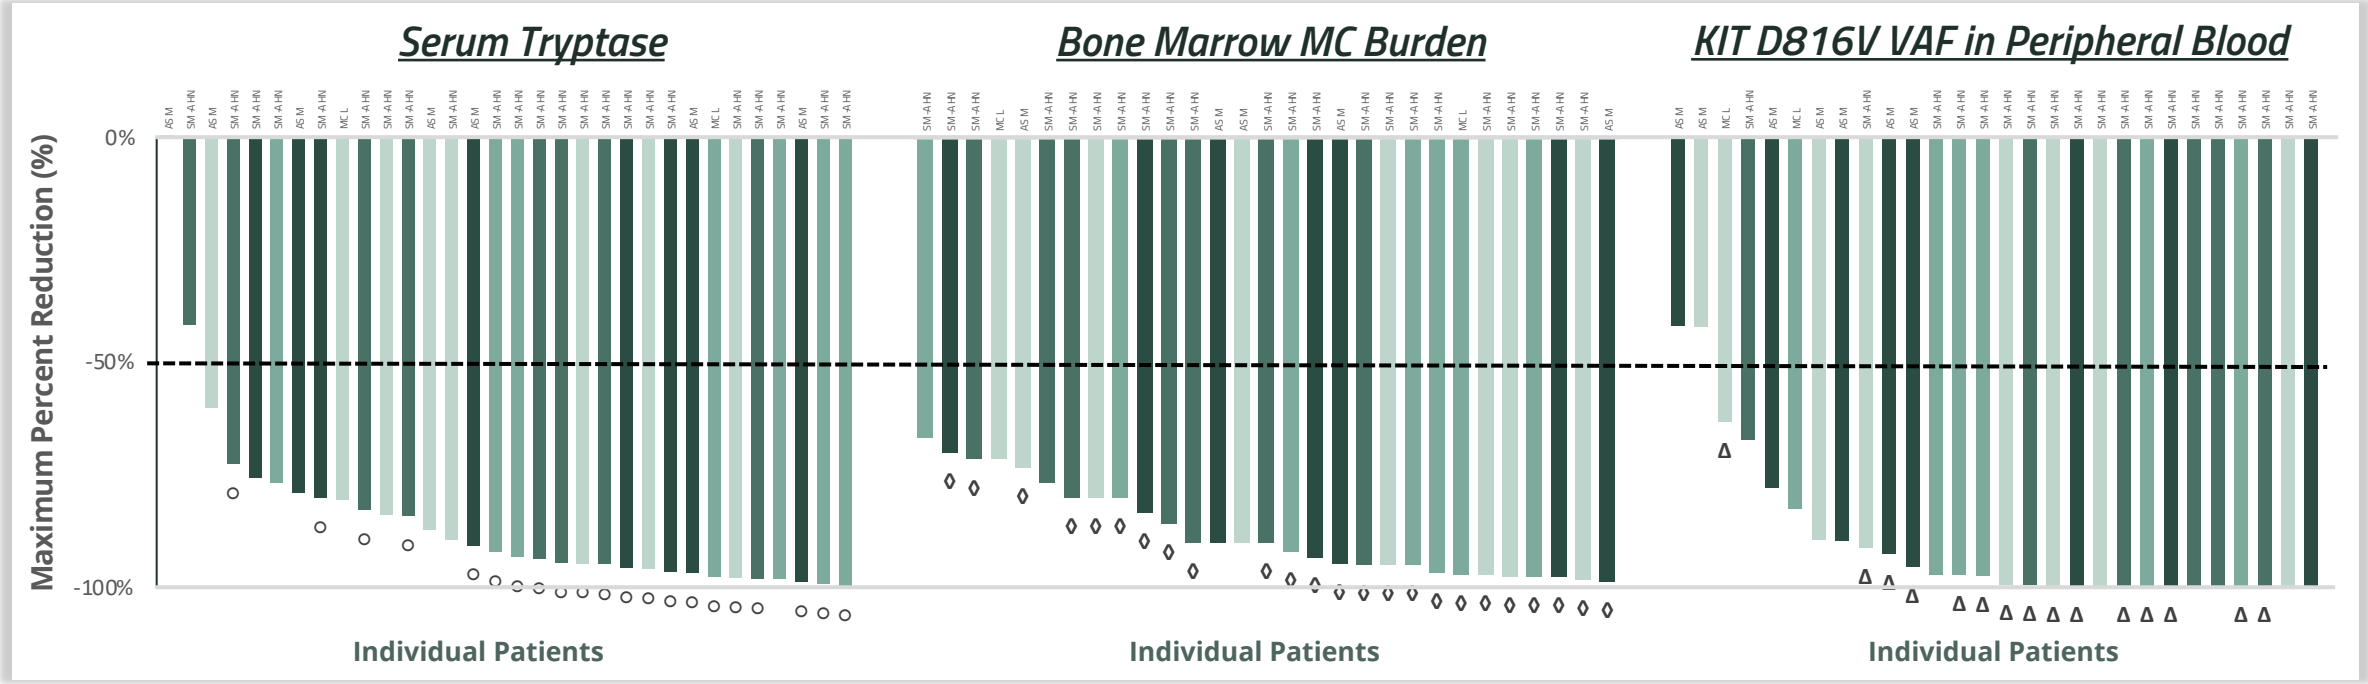
Bezuclastinib Demonstrates Deep Reductions in Markers of Mast Cell Burden



- 94% (30/32) achieved ≥50% reduction
- 100% (29/29) with at least 2 cycles of treatment achieved ≥50% reduction
- 66% (21/32) achieved <20 ng/mL

- 100% (29/29) with baseline and ≥1 post-baseline assessment achieved ≥50% reduction
- 83% (24/29) achieved complete clearance of mast cell aggregates by central review

- 93% (26/28) achieved a ≥50% reduction
- 71% (15/21) achieved VAF <1%

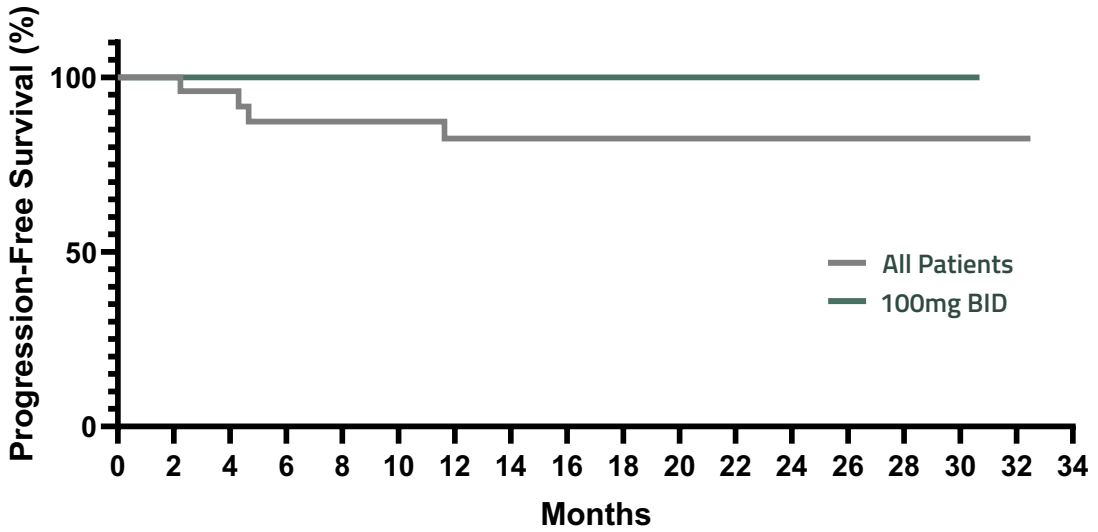
50 mg BID
100 mg BID
200 mg BID
400 mg QD

Milestone Achieved
○ <20 ng/mL serum tryptase
◊ Complete clearance of mast cell aggregates
Δ < 1% *KIT* D816V VAF

Data as of: 11Oct2024
DeAngelo DJ, et al. American Society of Hematology (ASH) 2024; San Diego, CA, 8 Dec 2024: Publication Number: 659

Median PFS and Duration of Response Were Not Reached

Progression-free survival (PFS[a]) in mIWG-MRT-ECNM-evaluable population (n=27)



Pts at Risk	0	2	4	6	8	10	12	14	16	18	20	22	24	26	28	30	32	34
All Pts	27	25	22	19	19	19	17	15	12	9	9	7	6	6	2	2	1	0
100 BID	7	7	7	7	7	7	7	7	6	5	4	4	3	3	3	2	0	0

- Median PFS not yet reached at median study follow-up of 20 months
- PFS rate was 82% at 24 months

Duration of response (DOR) (N=27)

- Median duration of response not yet reached
- Median (range) time to achieve mIWG-MRT-ECNM confirmed response of PR or better (CR, CRh, PR) was 2.2 (1.9-7.5) months

Disease Progression in Overall Population (N=32)

- No patients had SM progression
- 7 patients developed progression of AHN
  - AML transformation (3), progression of MDS (2), worsening of CMML (2)
  - 3 patients remained on bezuclastinib and began treatment with azacitidine in the rollover cohort

[a]PFS progression includes death or CRRC assessment of progressive disease
Data as of: 11Oct2024
DeAngelo DJ, et al. American Society of Hematology (ASH) 2024; San Diego, CA, 8 Dec 2024: Publication Number: 659

Elenestinib (BLU-263): A next-generation, potent, selective KIT D816V inhibitor

- **Elenestinib** is a novel, investigational, oral, next-generation tyrosine kinase inhibitor that is non-brain penetrant[1,2]
- **Potently** and **selectively** inhibits KIT D816V while **preferentially sparing** wild-type KIT

	KIT D816V phosphorylation IC_{50}	WT KIT proliferation IC_{50}	WT KIT phosphorylation IC_{50}
Elenestinib	**3.1 nM**	**95.9 nM**	**82.6 nM**
Avapritinib	**3.1 nM**	**85.8 nM**	**89.5 nM**
Bezuclastinib	**3.4 nM**	**26.4 nM**	**32.5 nM**

- **Well-characterized** product formulation allowing for **once-daily** (QD) dosing[1,2]

Selectivity profiles of KIT D816V inhibitors in clinical development or approved for systemic mastocytosis

Drug:	Elenestinib	Avapritinib	Bezuclastinib
Kinome tree[a]:			Selectivity S-score: (fraction of kinome bound by drug, more selective = lower s-score)	0.035	0.035	0.057
	First in human 2020, investigational	First in human Oct 2015, **approved**	First in human Mar 2015, investigational

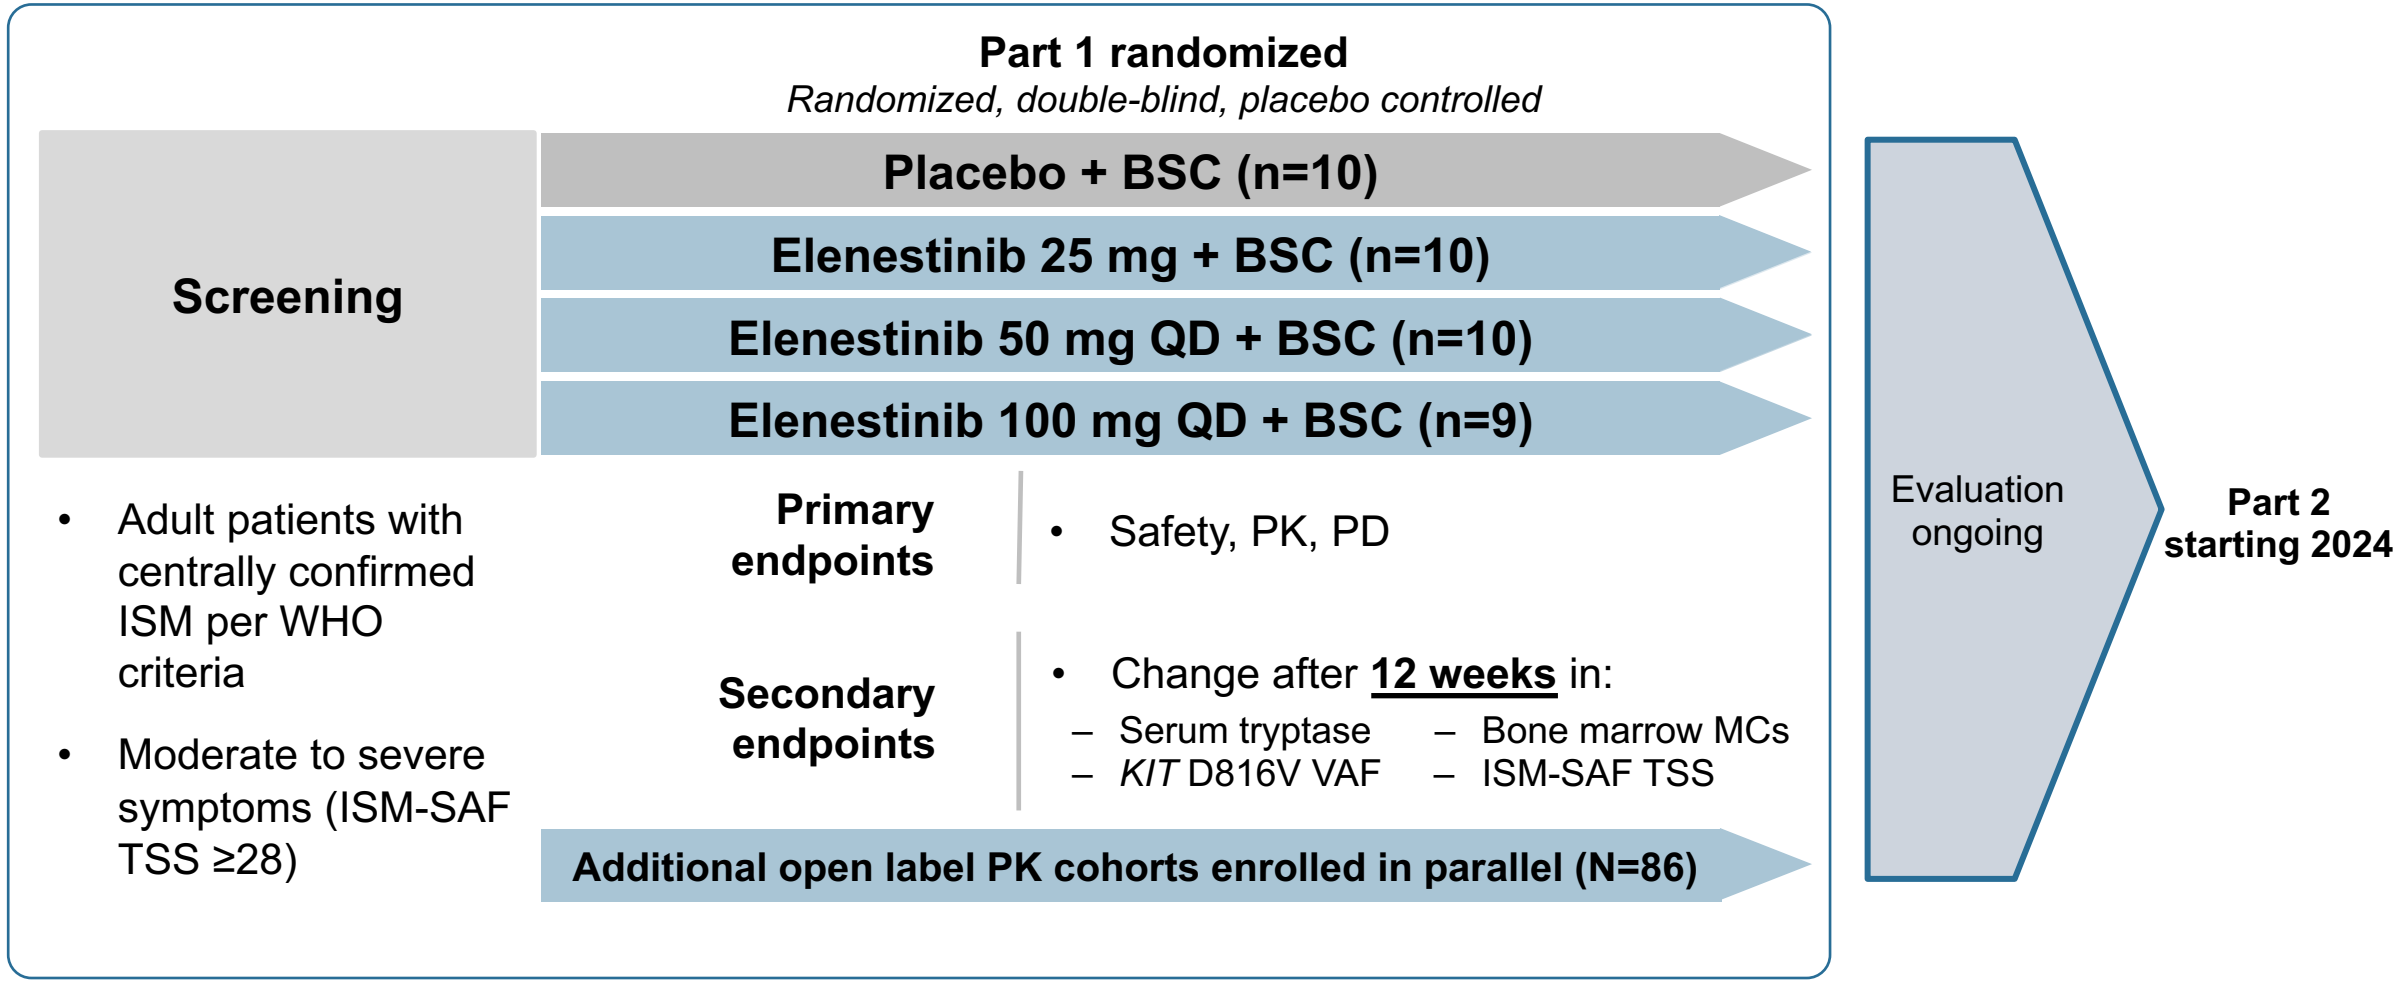
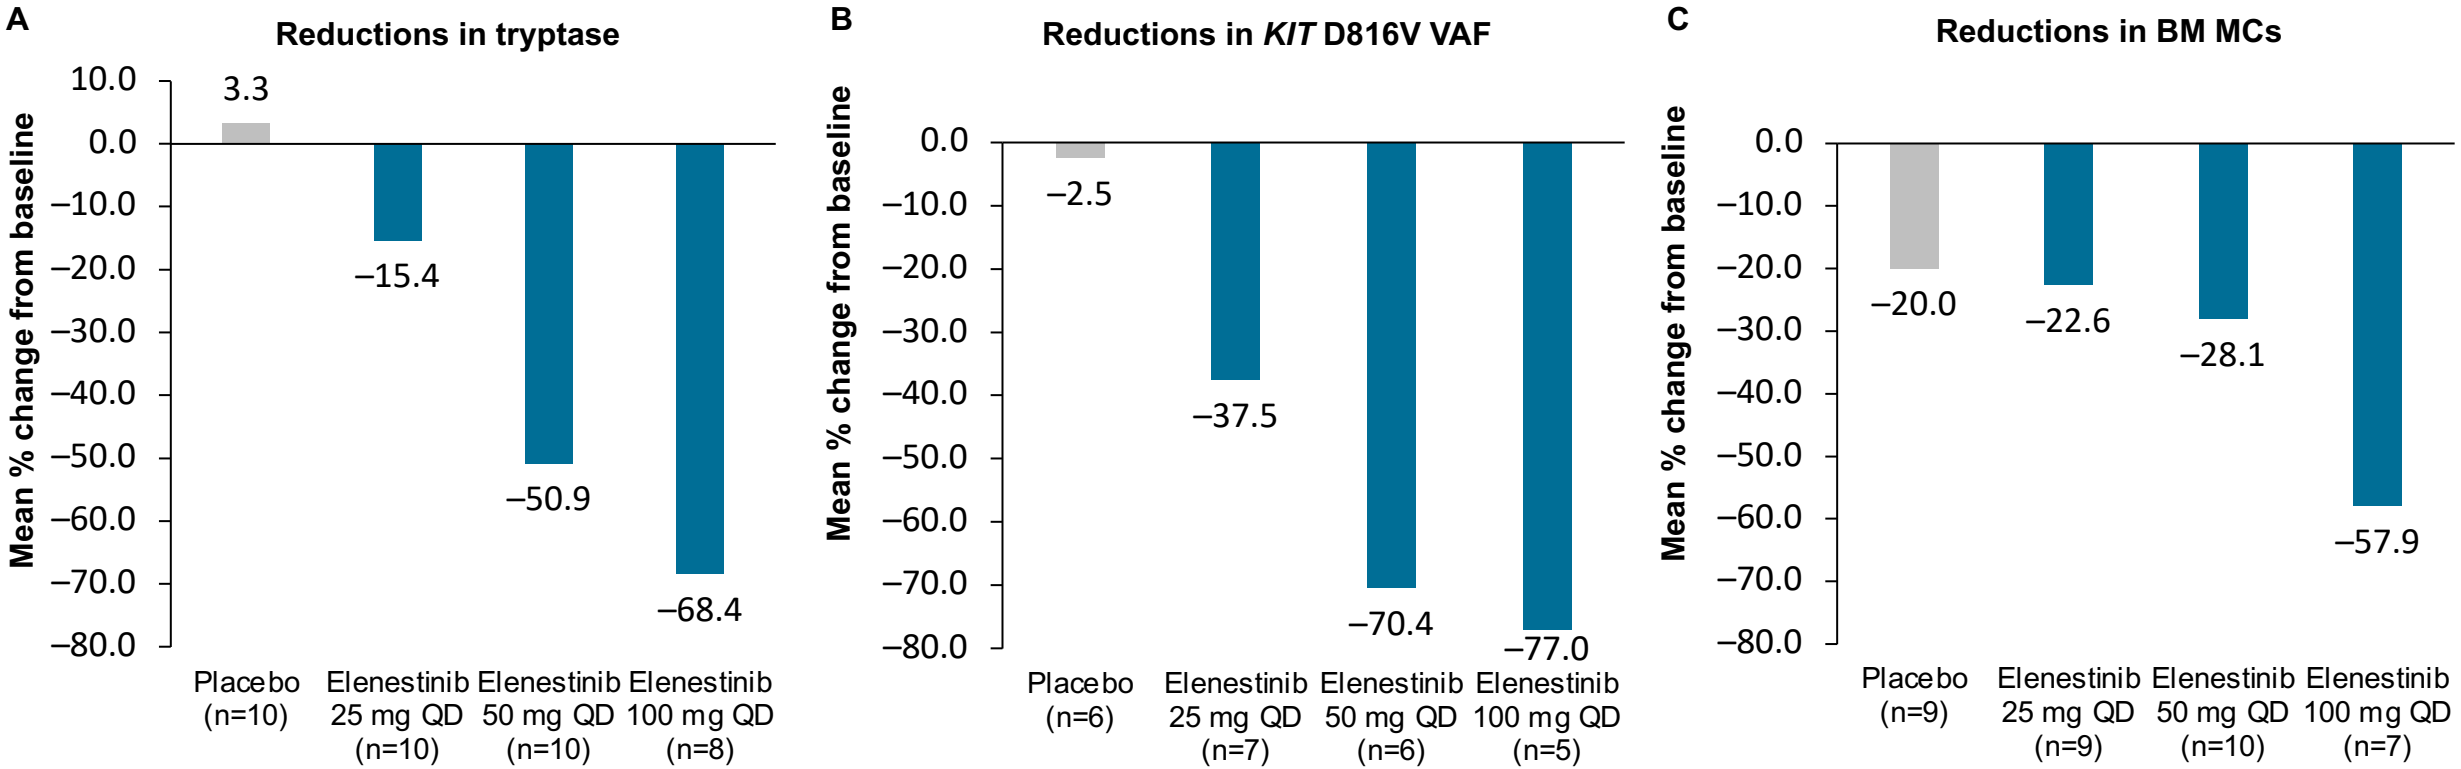
HARBOR Part 1[a]: Randomized, double-blind, placebo-controlled dose-finding part of elenestinib



[a]NCT04910685.
BSC, best supportive care; PD, pharmacodynamics; PK, pharmacokinetic; VAF, variant allele fraction; WHO, World Health Organization.

After 12 weeks of elenestinib, all biomarkers of disease burden improved

- Patients receiving elenestinib at doses of 25 mg, 50 mg, and 100 mg QD demonstrated dose-dependent mean percent reductions from baseline in **serum tryptase levels (A), *KIT* D816V VAF (B)**, and **bone marrow MCs (C)** *versus* placebo

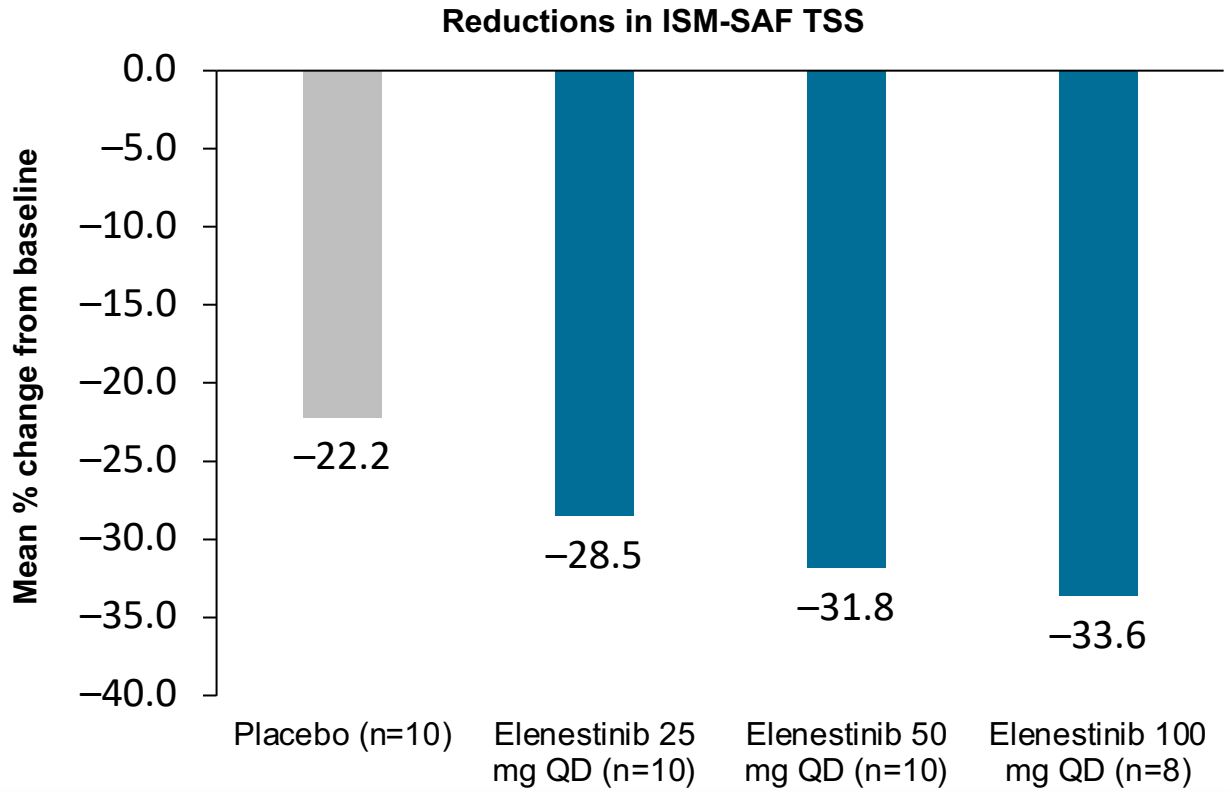


BM, bone marrow.

Tashi T et al. ASH 2023;Abstract 76.

After 12 weeks of elenestinib, symptom improvement was observed for all dose cohorts

- All elenestinib dose cohorts demonstrated clinically meaningful changes in symptoms without clear dose dependence
- Percentage change of symptom reduction in TSS was greater for patients on elenestinib *versus* placebo in the blinded portion of Part 1



Tashi T et al. ASH 2023;Abstract 76.

Discussion Questions

- A patient with indolent systemic mastocytosis is initially treated with H1 and H2 blockers, montelukast and cromolyn sodium but after 6 months continues to report daily pruritus, frequent urticarial reactions to various stimuli, brain fog and fatigue (platelet count ≥50,000/μL). What would you most likely recommend?

Discussion Questions

- Regulatory and reimbursement issues aside, what initial therapy would you most likely recommend for a patient with aggressive systemic mastocytosis and mild to moderate cognitive impairment (platelet count ≥50,000/μL)?

- How, if at all, does the presence of thrombocytopenia affect your choice of treatment of systemic mastocytosis?

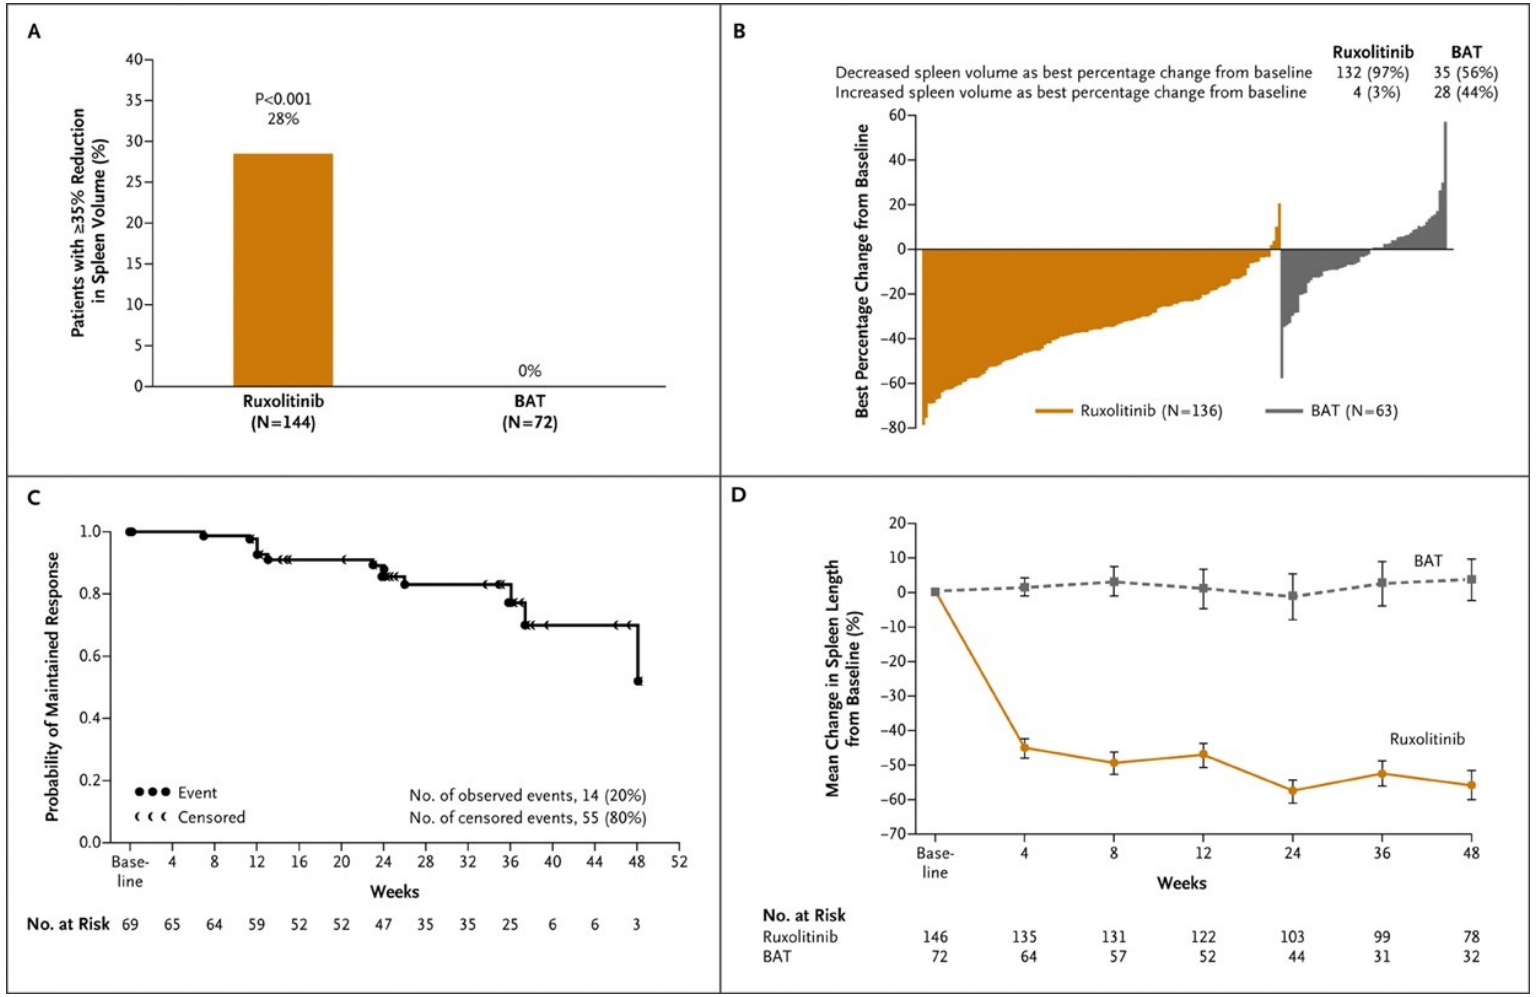
Ruxolitinib reduces spleen volume, improves symptoms and is associated with a survival benefit

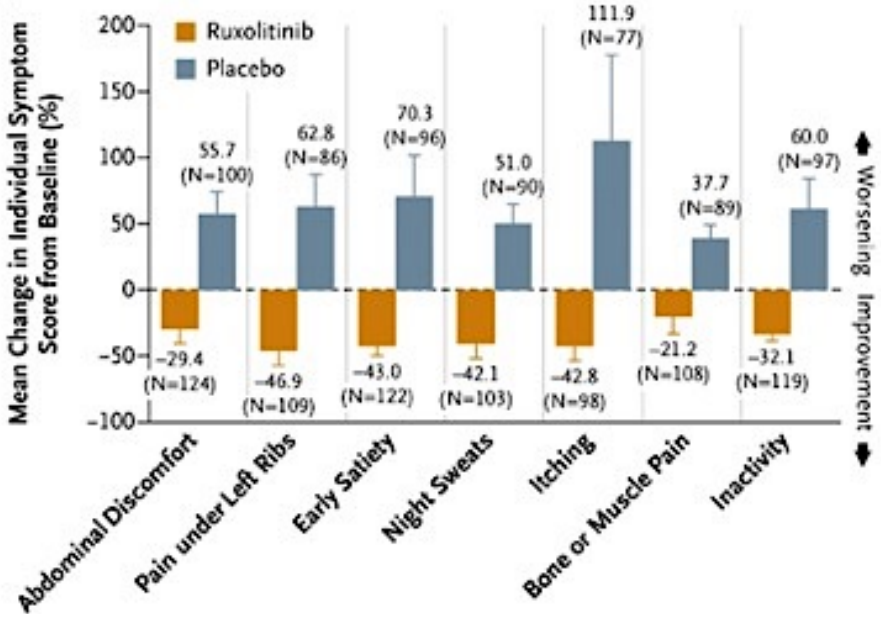


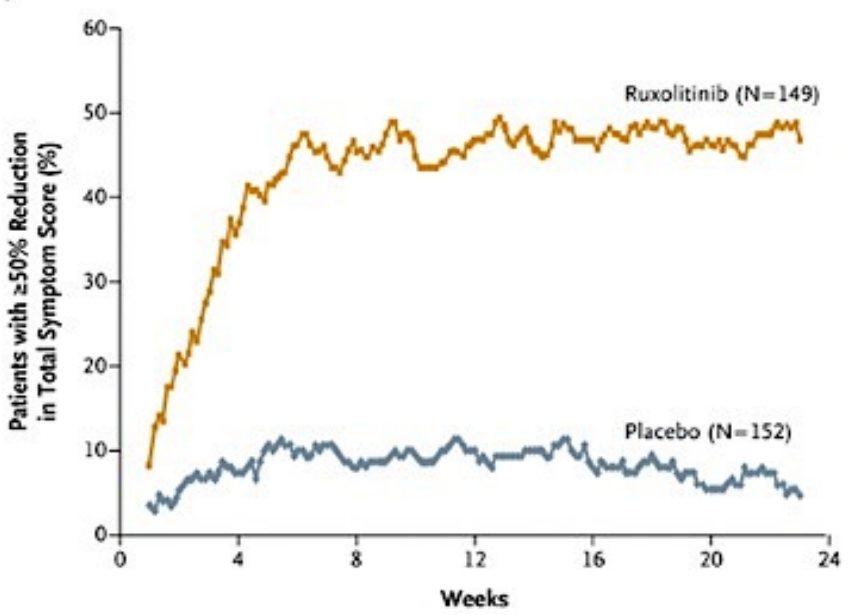
Pre Ruxolitinib

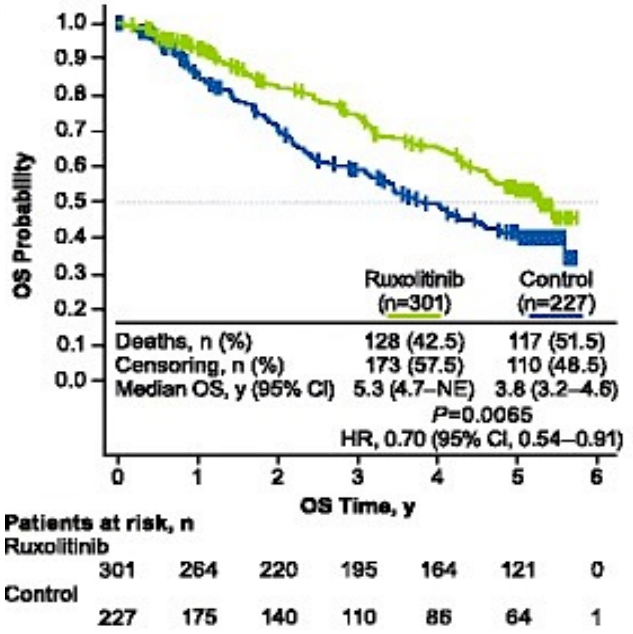
After 2 Mo Therapy

Harrison et al., NEJM, 2012; Images courtesy of Srdan Verstovsek, MD, PhD.

Ruxolitinib effectively reduces spleen volume, improves disease related symptoms, and is associated with a survival benefit

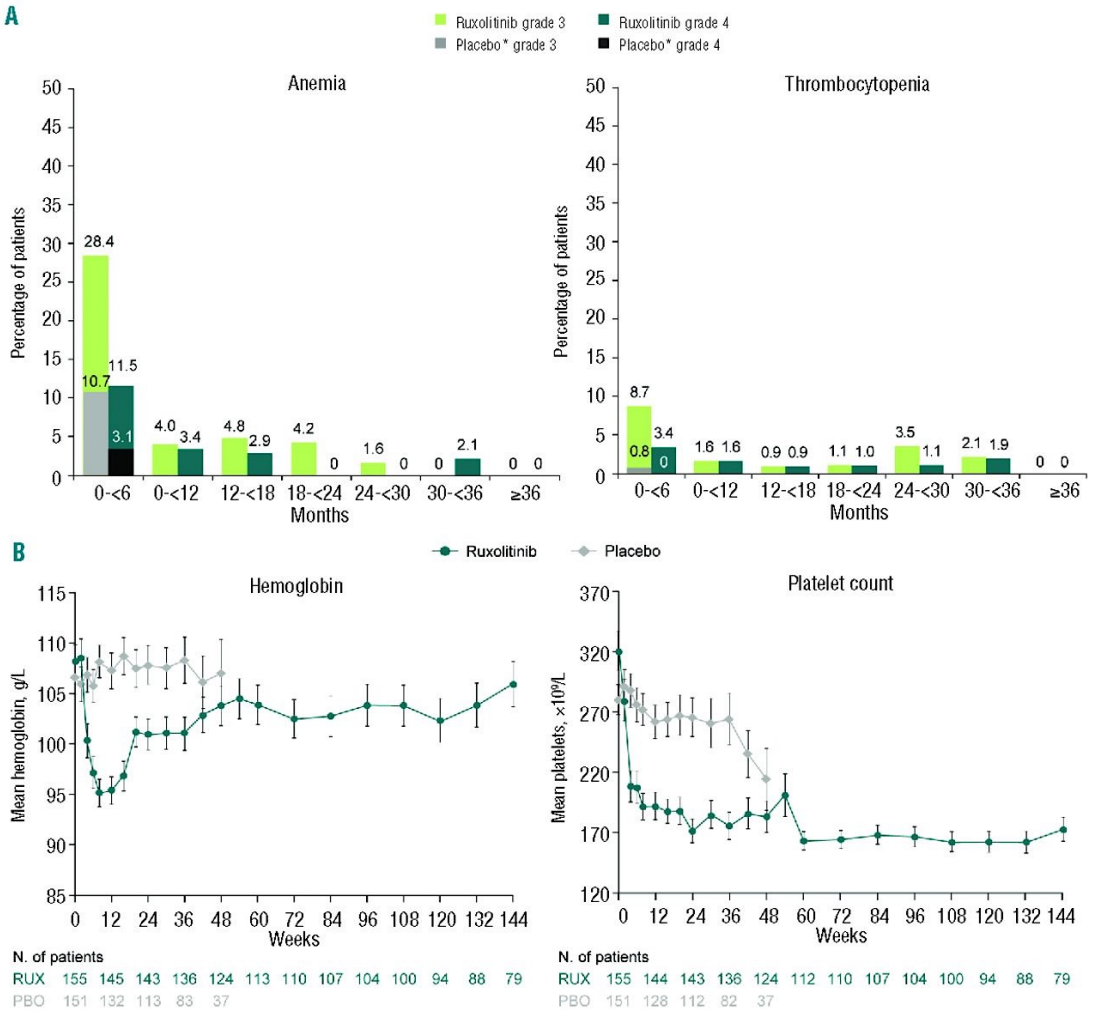


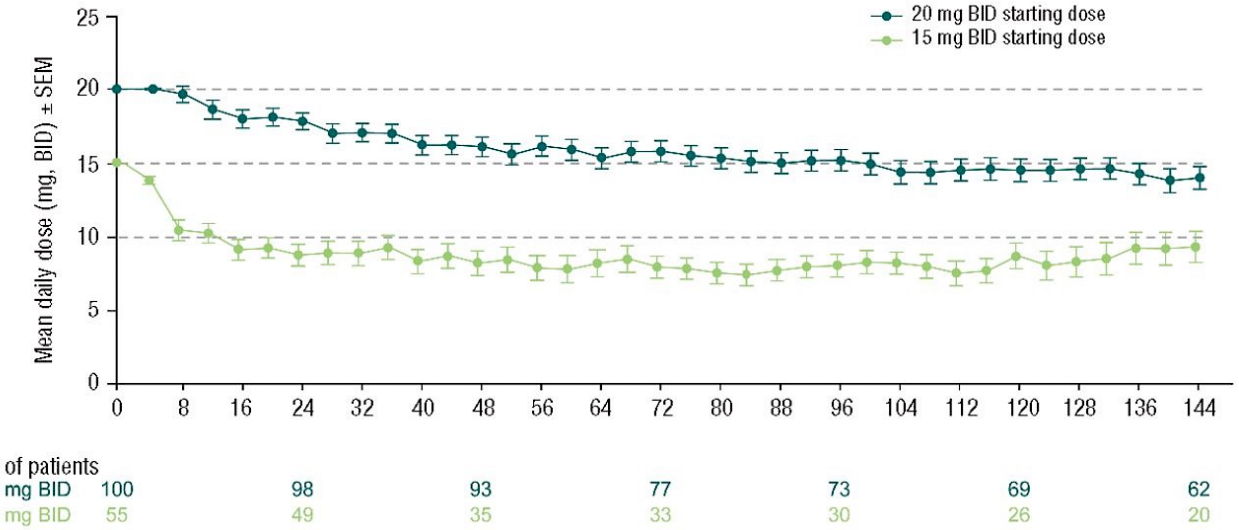




Verstovsek et al., NEJM, 2012; Verstovsek et al., J Hematol Oncol, 2017

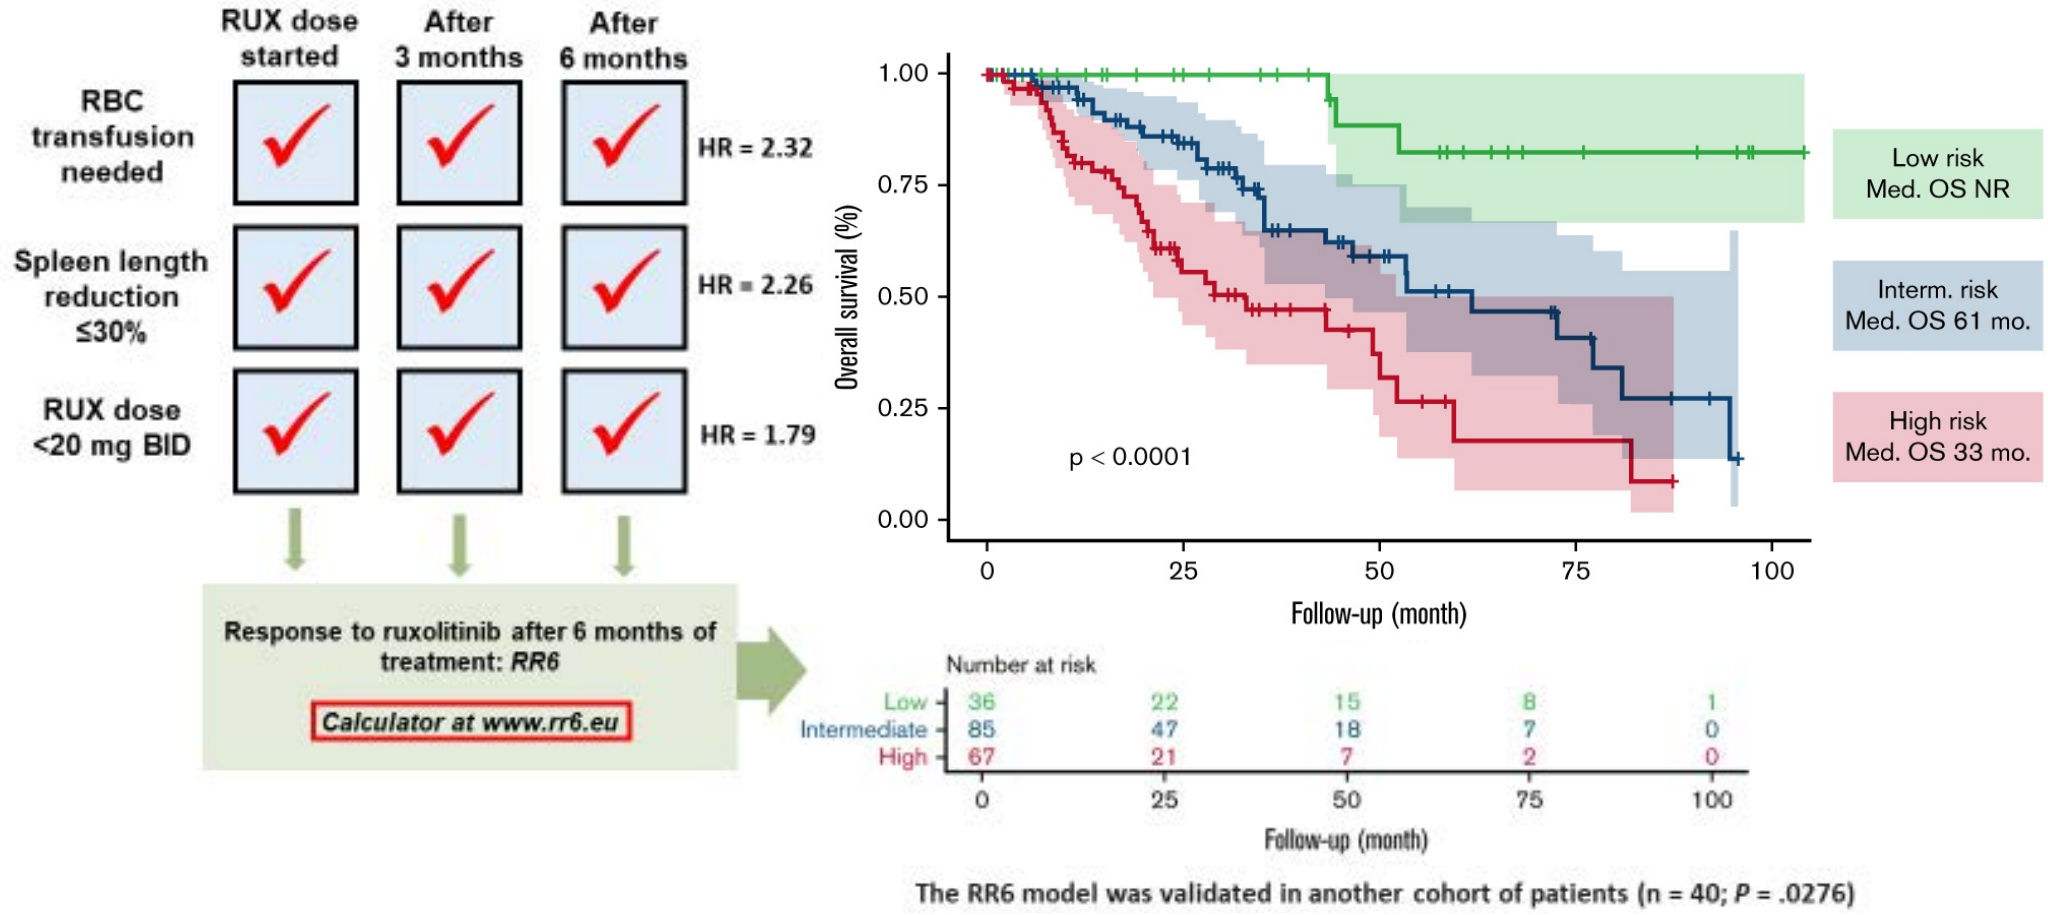
Ruxolitinib associated with anemia and thrombocytopenia that frequently lead to dose reductions





Verstovsek et al. Haematologica. 2015.

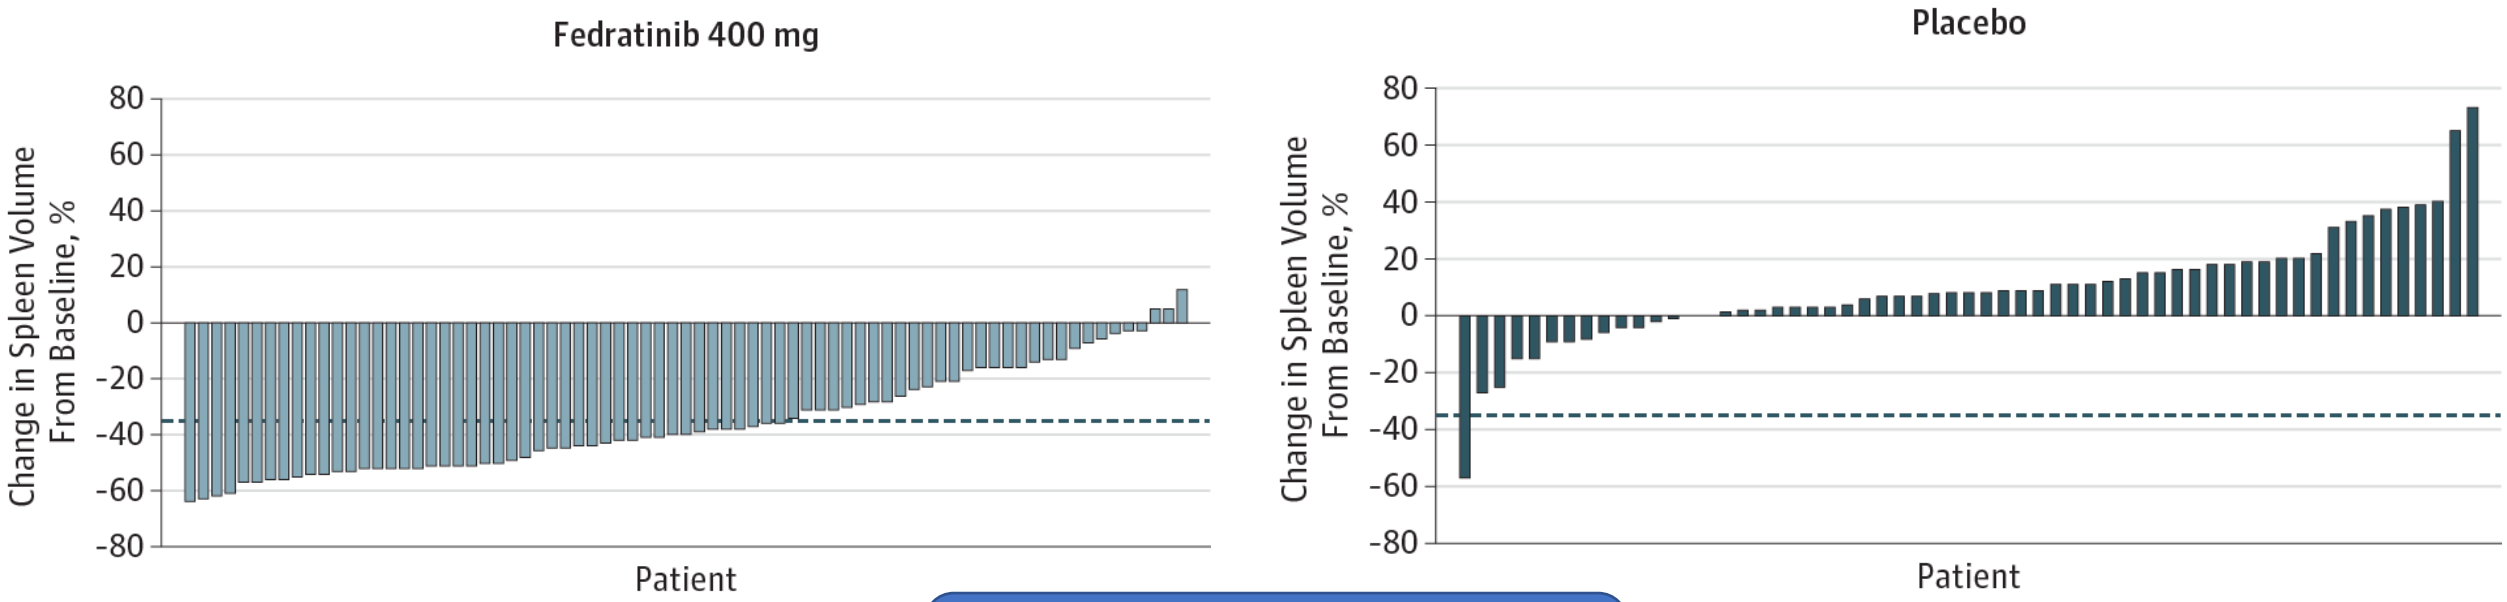
The RR6 model identifies transfusion requirements, lack of spleen response, and suboptimal dosing as risk factors for worse outcomes in patients treated with ruxolitinib



The RR6 model was validated in another cohort of patients (n = 40; *P* = .0276)

Maffioli et al., Blood Adv. 2022;6:1855-1864

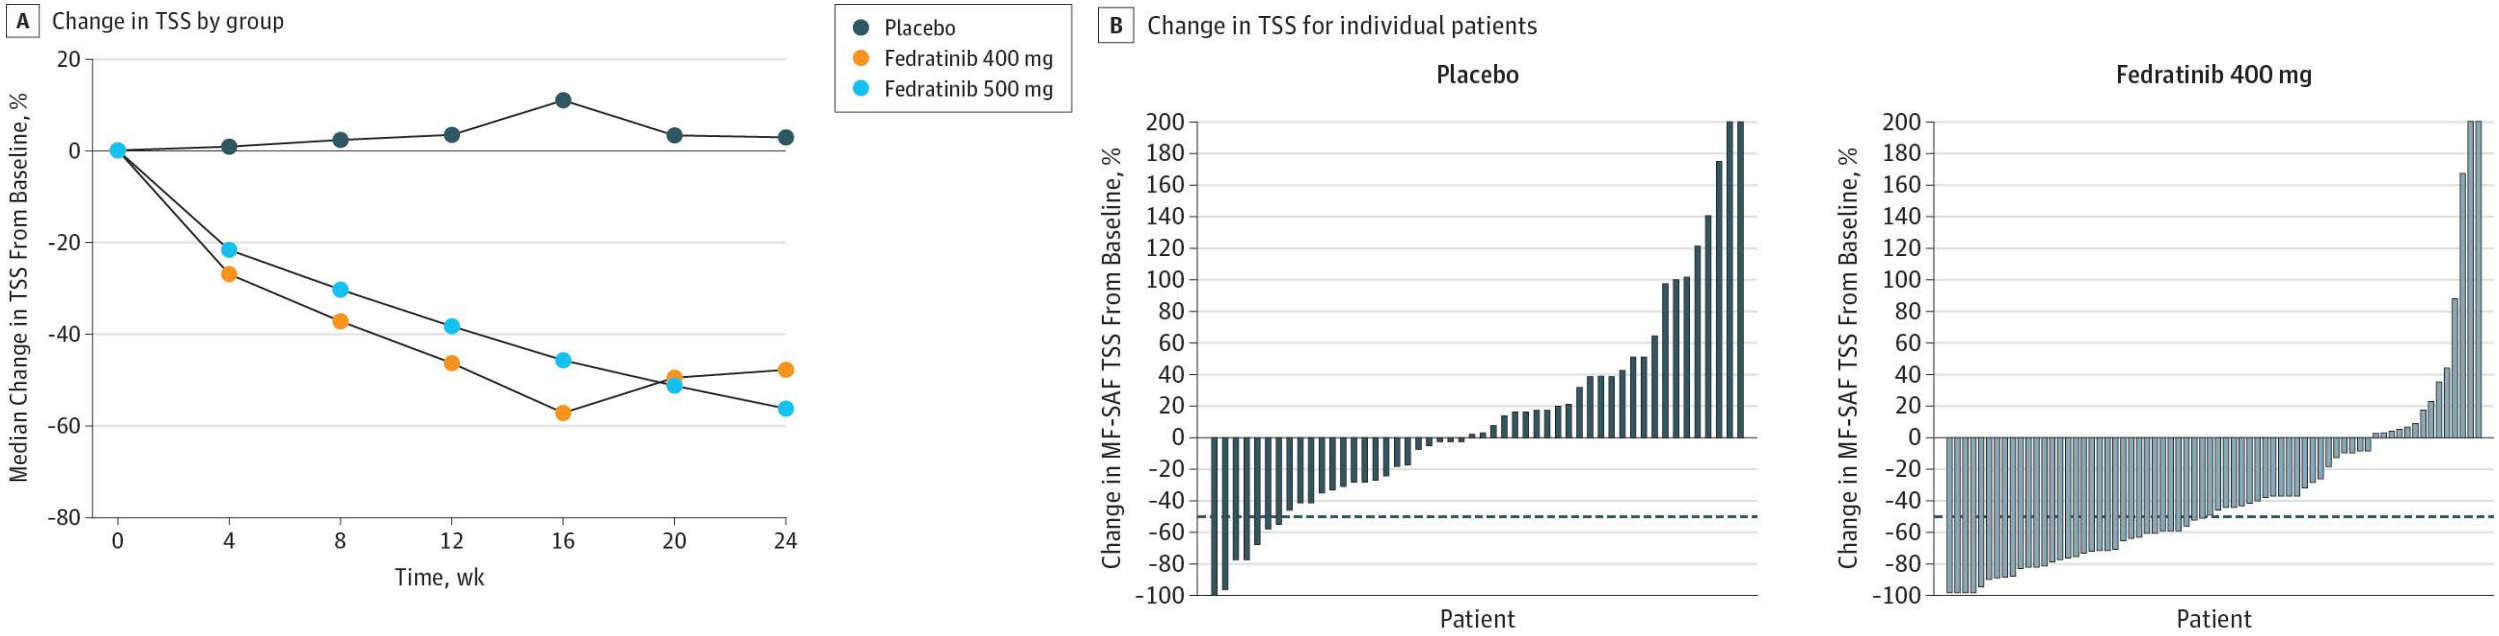
Fedratinib improves splenomegaly and symptoms comparably to ruxolitinib



Approved for int-2 and high-risk MF in August, 2019

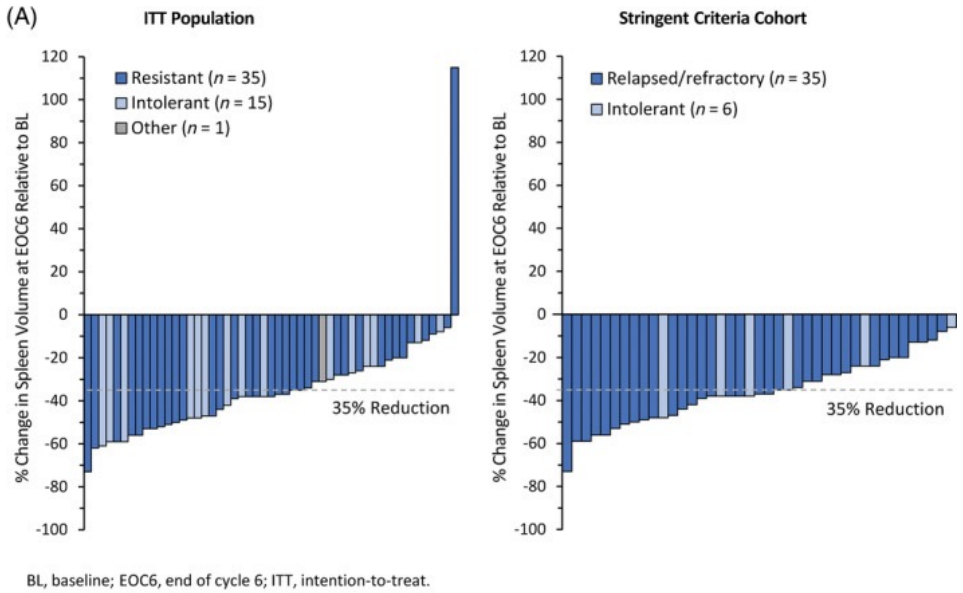
Pardanani et al., JAMA Oncology, 2015

Fedratinib improves splenomegaly and symptoms comparably to ruxolitinib

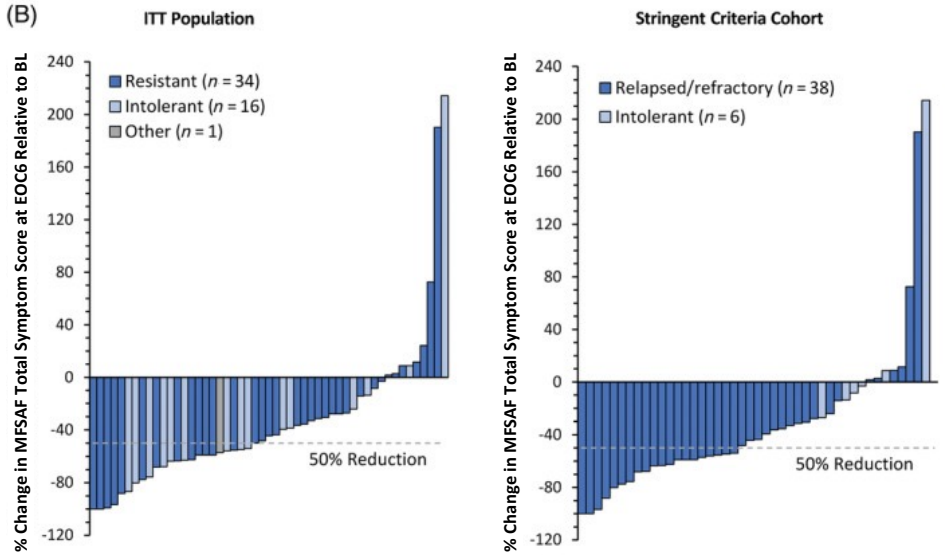


Pardanani et al., JAMA Oncology, 2015

Fedratinib improved splenomegaly and symptoms in the second-line setting in JAKARTA-2



BL, baseline; EOC6, end of cycle 6; ITT, intention-to-treat.

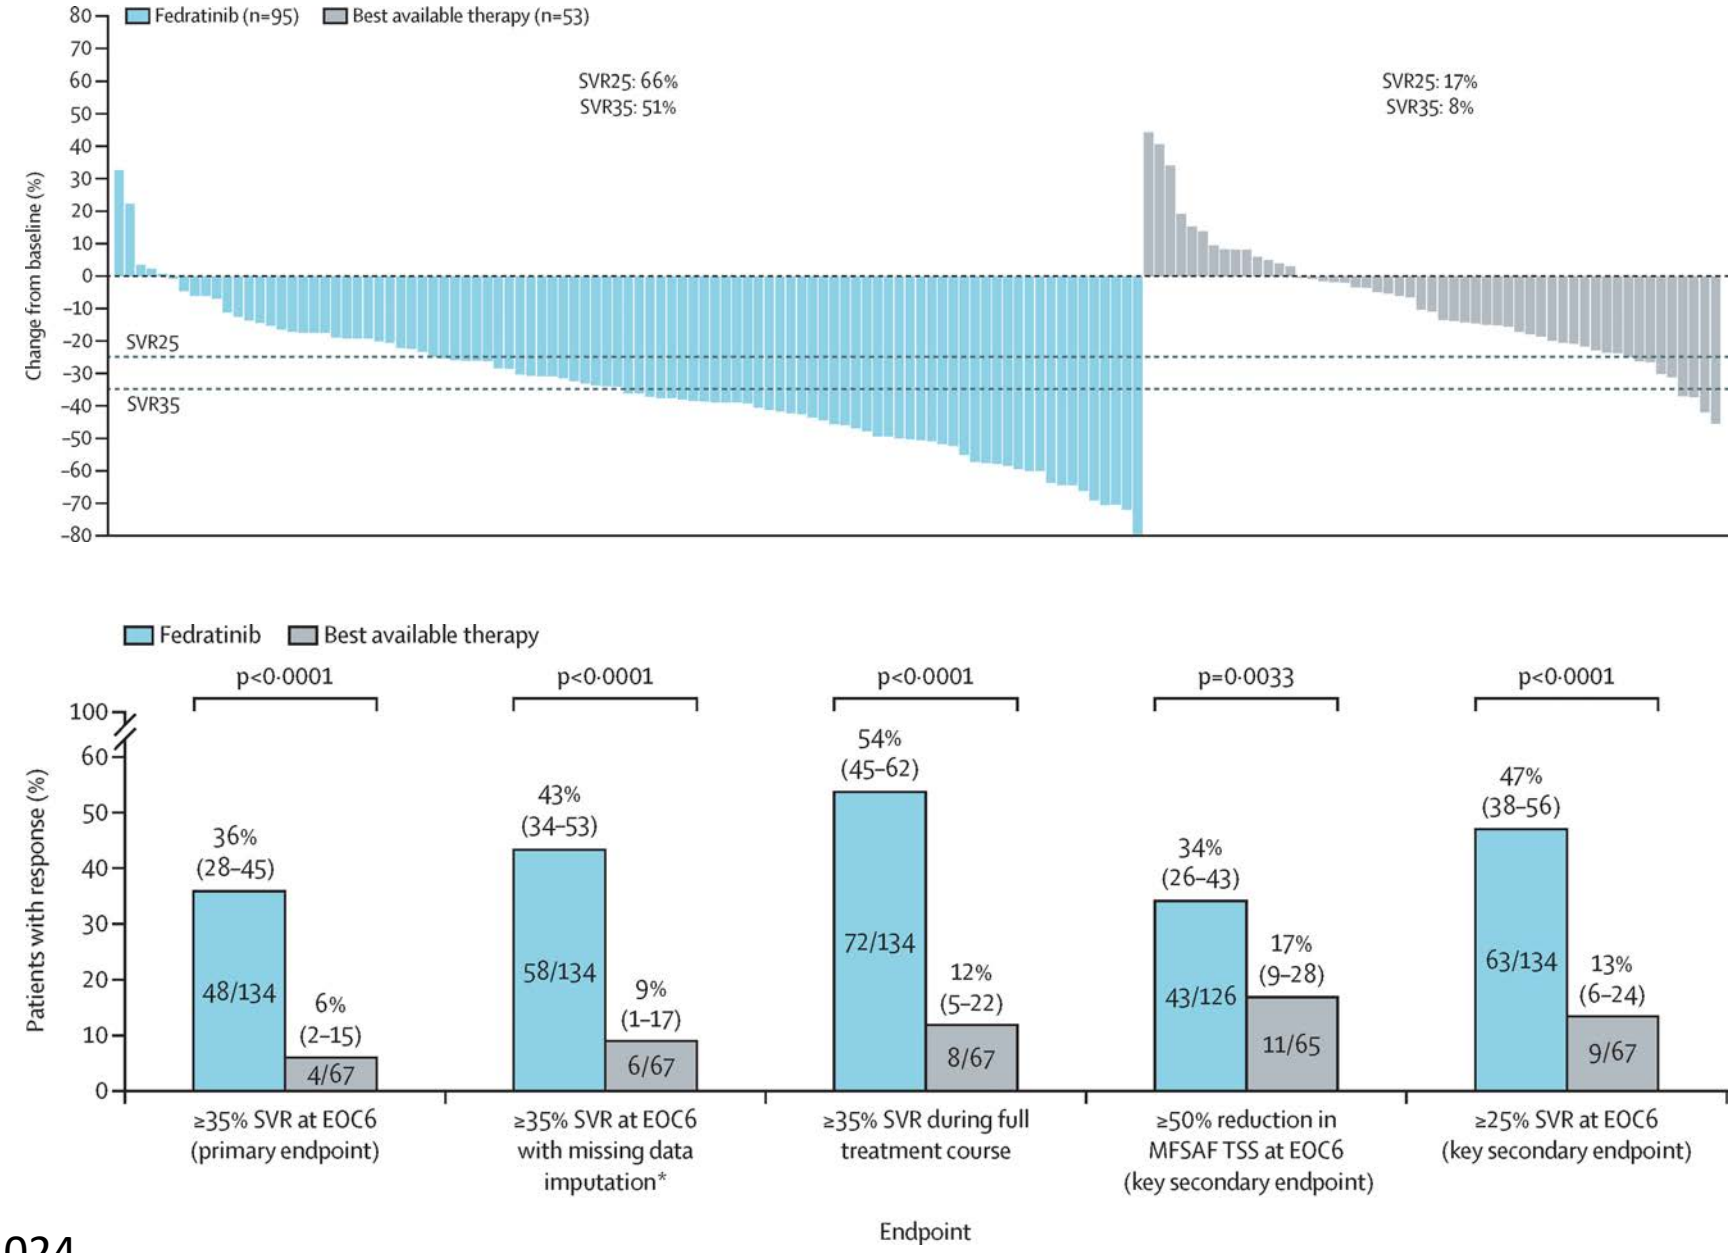


BL, baseline; EOC6, end of cycle 6; ITT, intention-to-treat; MFSAF, Myelofibrosis Symptom Assessment Form; TSS, total symptom score.

Harrison et al., Am J Hematology, 2020

FREEDOM-2 study largely recapitulated data seen in JAKARTA-2

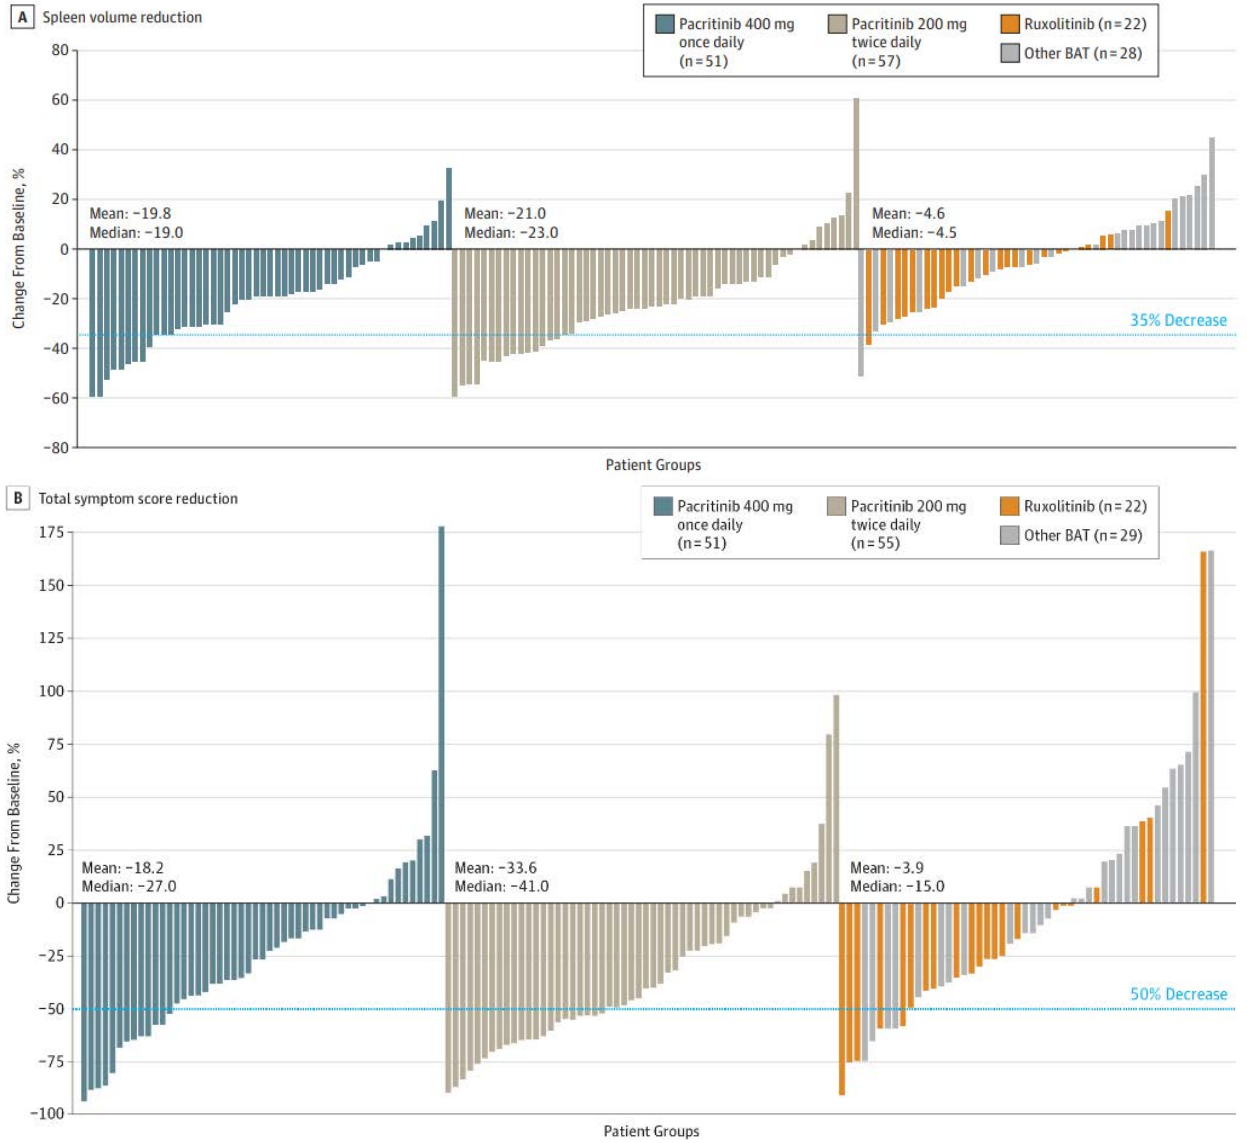
Dose reduction due to TEAE in 31% of fedratinib-treated patients



Harrison et al., Lancet Haematology. 2024

Pacritinib is a JAK2 inhibitor with accelerated approval for MF with marked thrombocytopenia

PERSIST-2 Study enrolled patients with MF with platelet count < 100 x 10^9/L

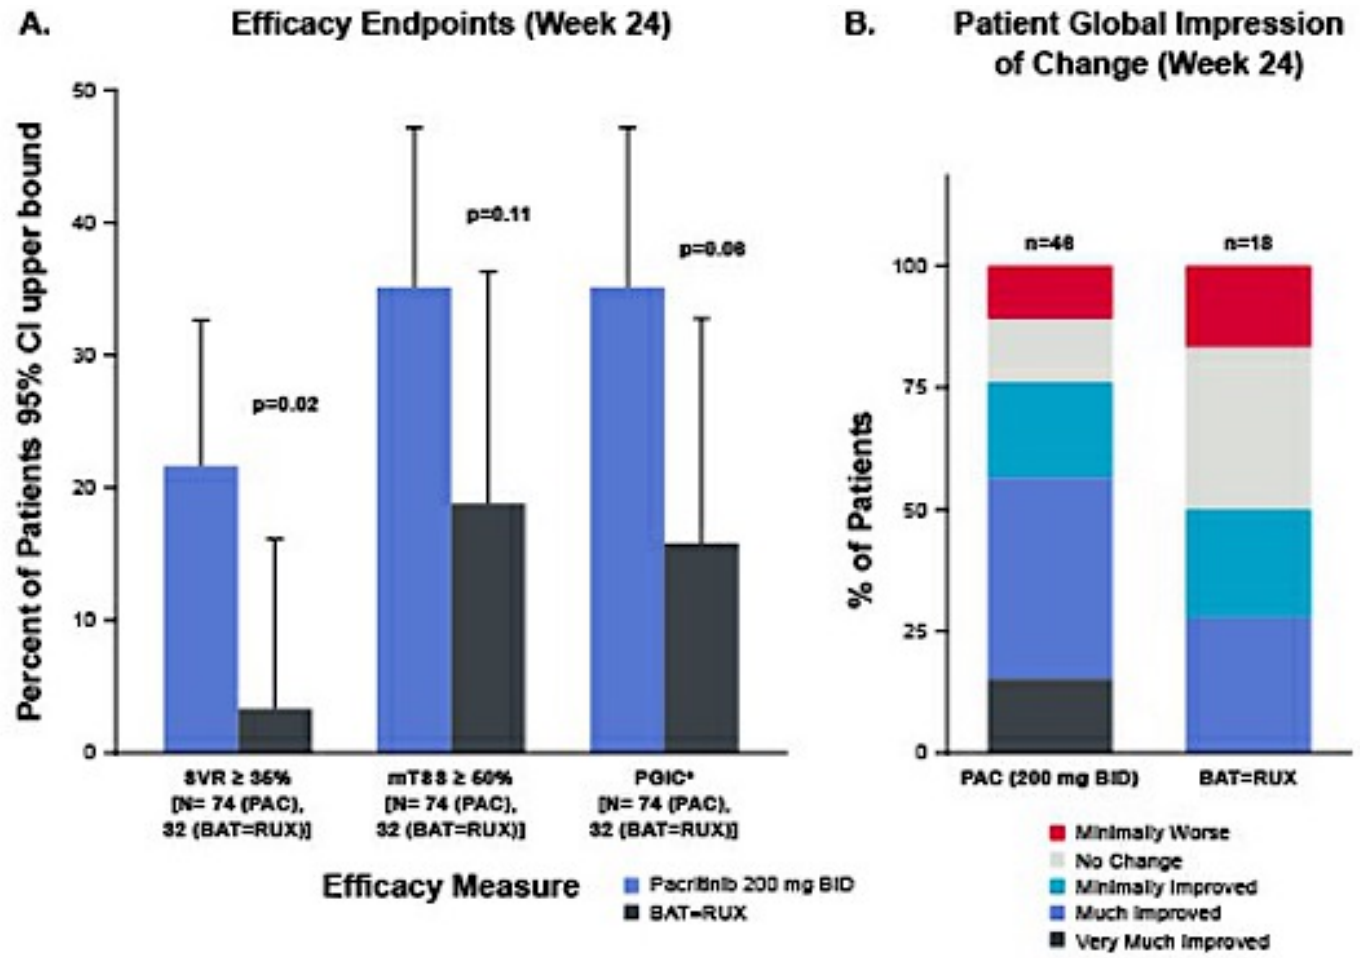


Received accelerated approval for MF with marked thrombocytopenia in February, 2022

Pacritinib inhibits JAK2, FLT3, IRAK1, and ACVR1

Mascarenhas et al., JAMA Oncol, 2018

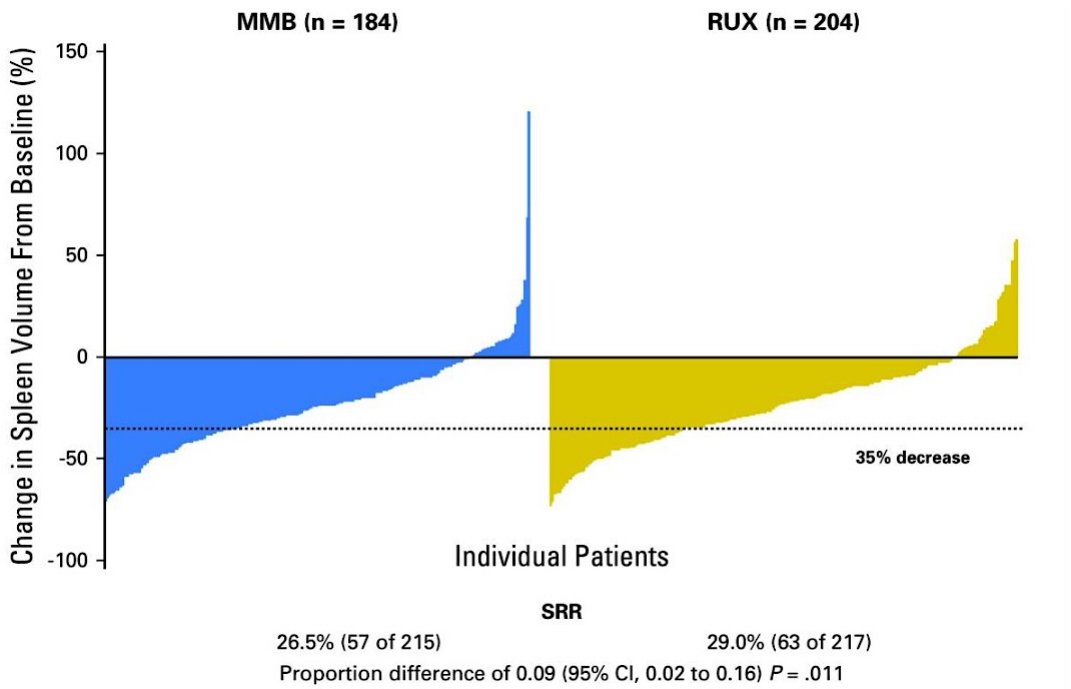
Pacritinib shows favorable efficacy profile in markedly thrombocytopenic patients compared to ruxolitinib

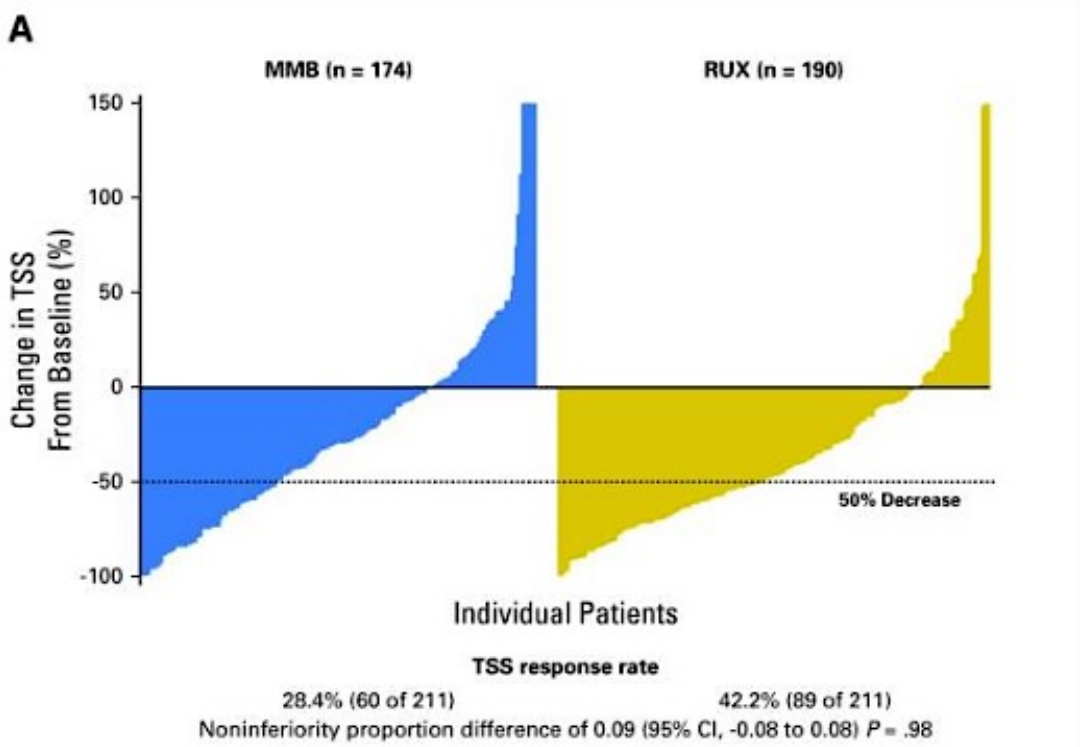


Harrison et al. Presented at EHA 2022.

Momelotinib was studied head-to-head vs. ruxolitinib in the SIMPLIFY-1 study.

Head-to-head vs. ruxolitinib: Momelotinib non-inferior for spleen reduction but NOT non-inferior for symptom improvement



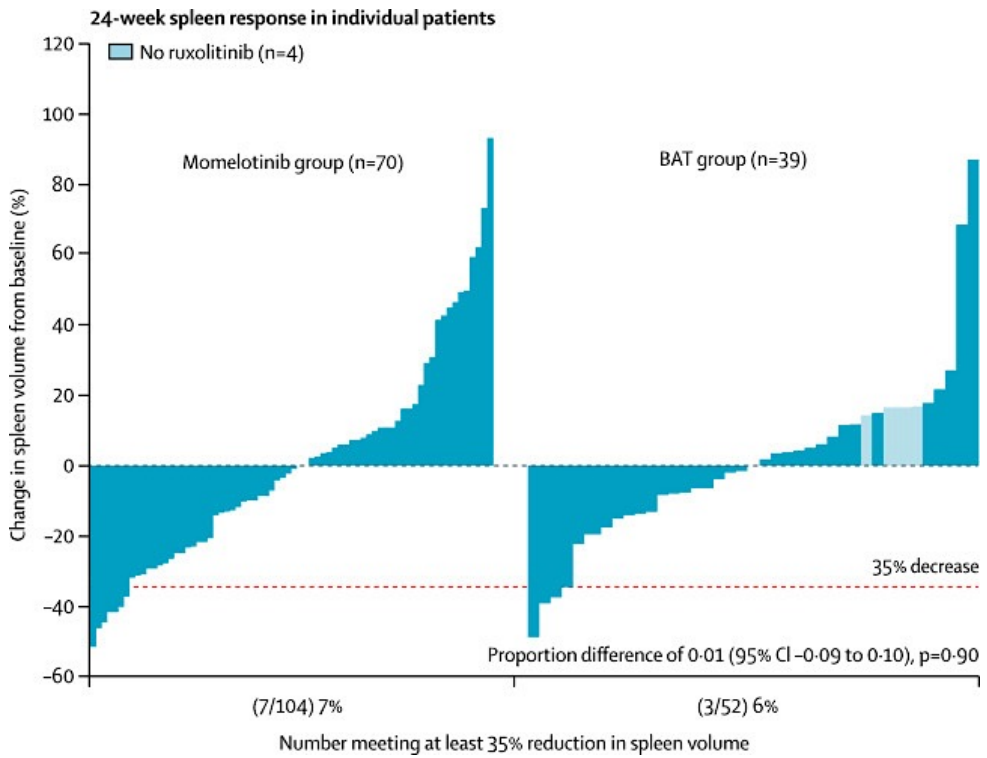


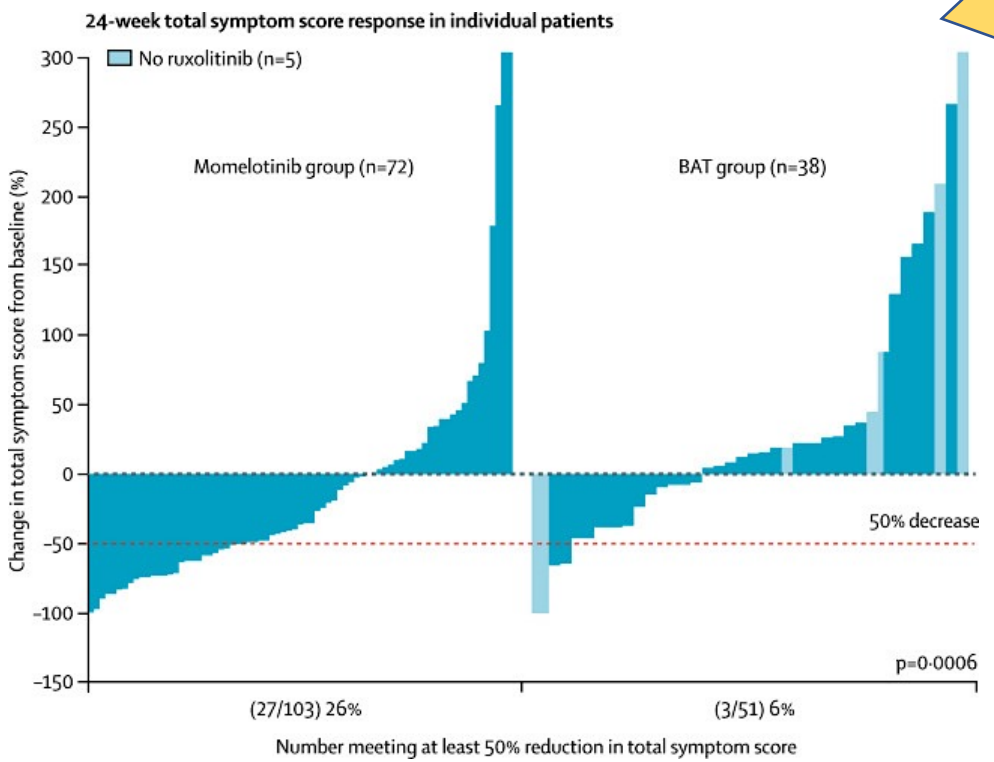
Mesa et al., JCO, 2017

Momelotinib was studied vs. BAT in rux-exposed patients in the SIMPLIFY-2 study

In comparison to BAT (89% rux) in rux-exposed patients, momelotinib was superior in terms of symptom response but not superior in terms of spleen response

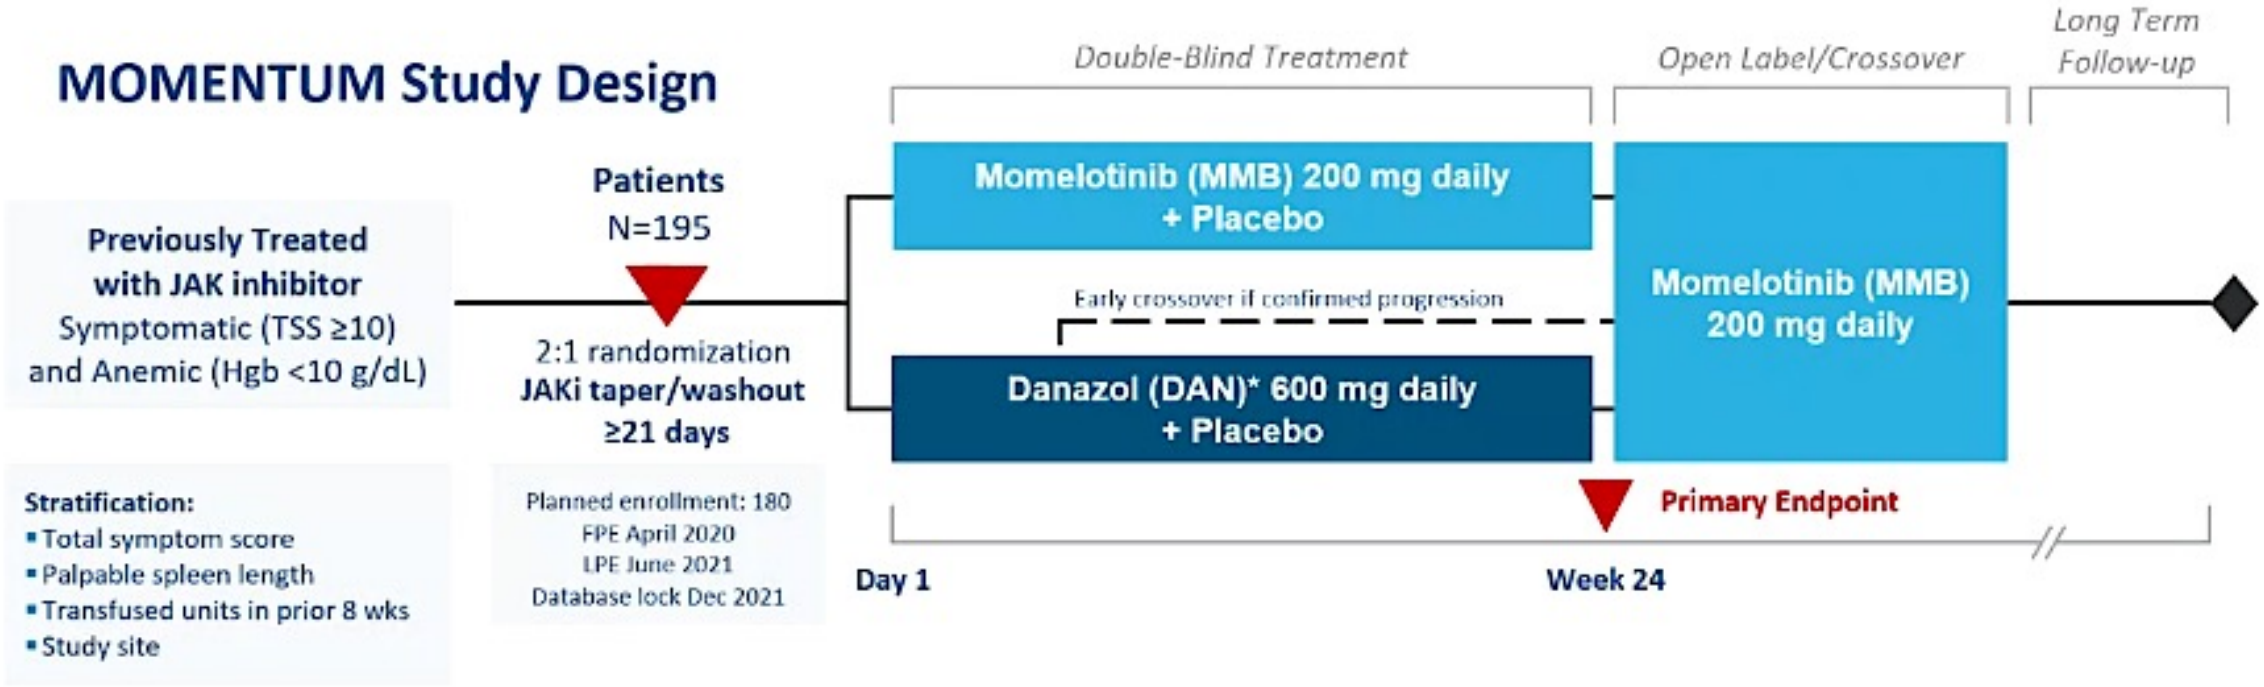
No washout





Harrison et al., Lancet Haematology, 2018

The experience in SIMPLIFY-1 and SIMPLIFY-2 trials led to the unique MOMENTUM study design



Primary Endpoint

- Total symptom score (TSS) response rate at Week 24

Key Secondary Endpoints

- Transfusion independence (TI) rate at Week 24
- Splenic response rate (SRR) at Week 24

Momelotinib was superior to danazol in the MOMENTUM study

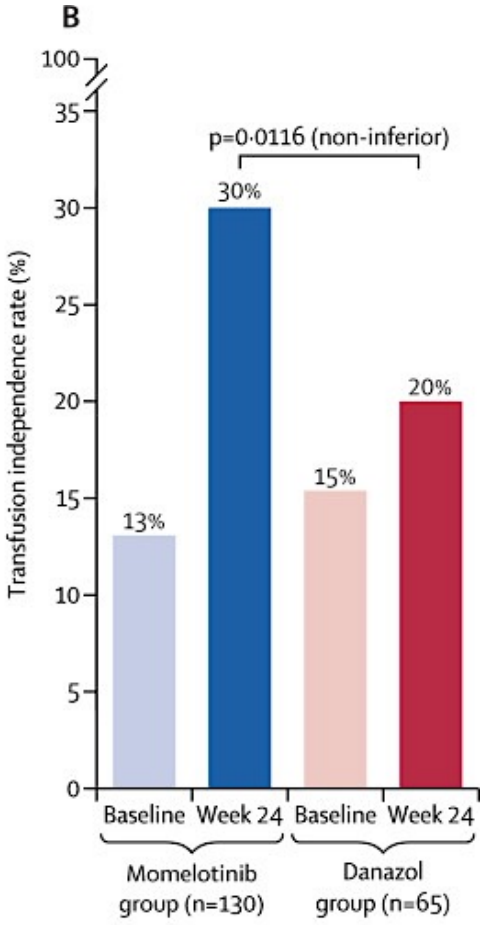
	Momelotinib group (n=130)	Danazol group (n=65)	Proportion difference (95% CI)	p value
Number meeting at least 50% reduction in MSAF TSS at week 24	32 (25% [95% CI 17–33])	6 (9% [95% CI 4–19])	16% (6–26)	0·0095

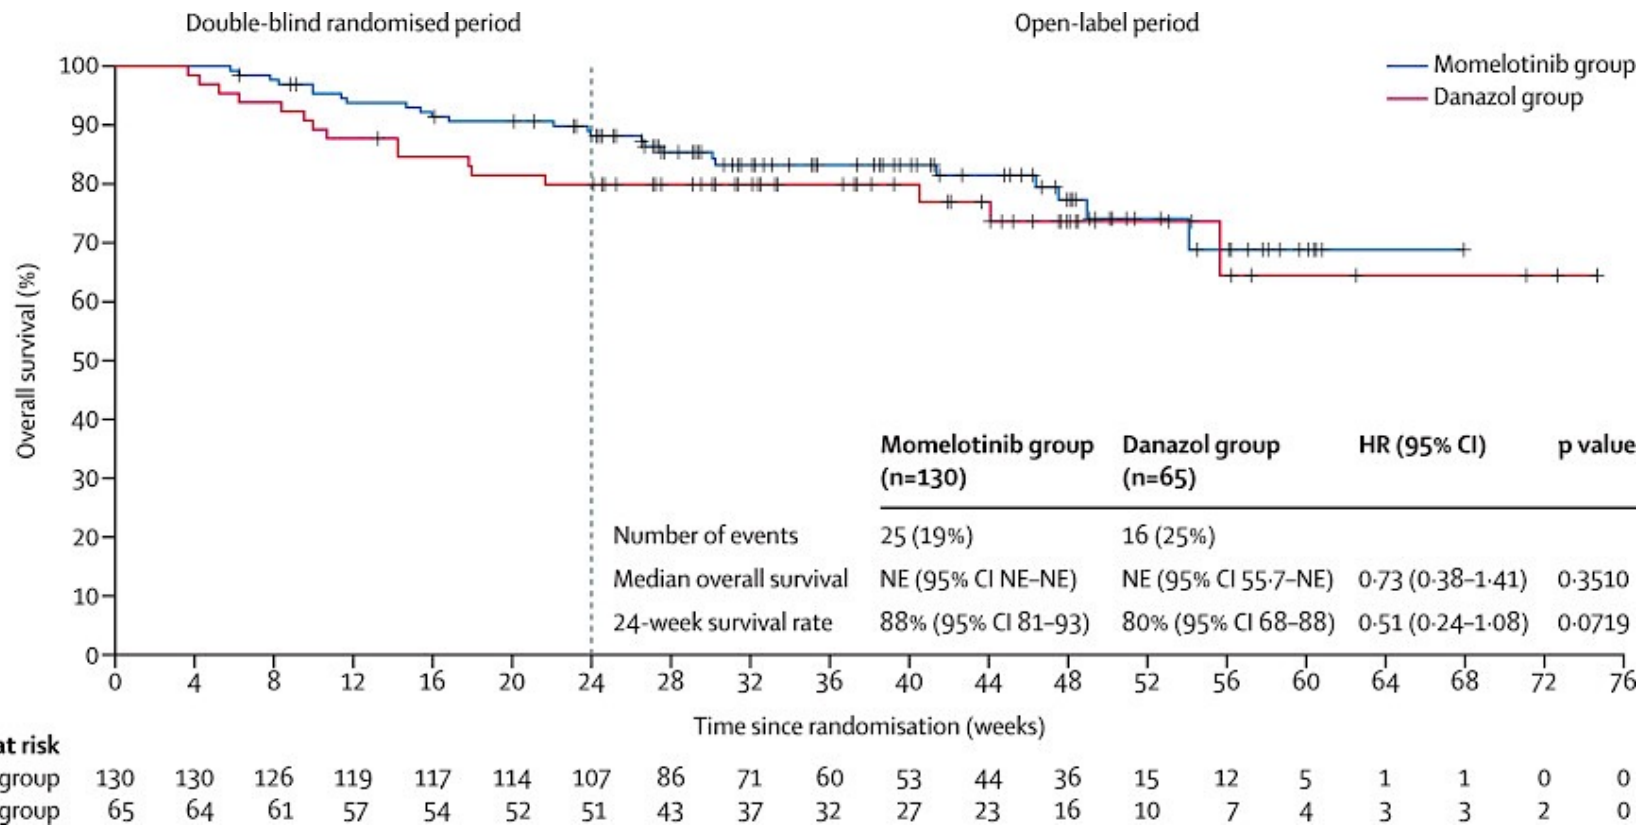
	Momelotinib group (n=130)	Danazol group (n=65)	Proportion difference (95% CI)	p value
Number meeting at least 25% reduction in spleen volume	51 (39% [95% CI 31–48])	4 (6% [95% CI 2–15])	33% (23–44)	<0·0001
Number meeting at least 35% reduction in spleen volume	29 (22% [95% CI 15–30])	2 (3% [95% CI 0–11])	18 (10–27)	0·0011

Momelotinib inhibits JAK1, JAK2, and ACVR1

Verstovsek et al., Lancet, 2023

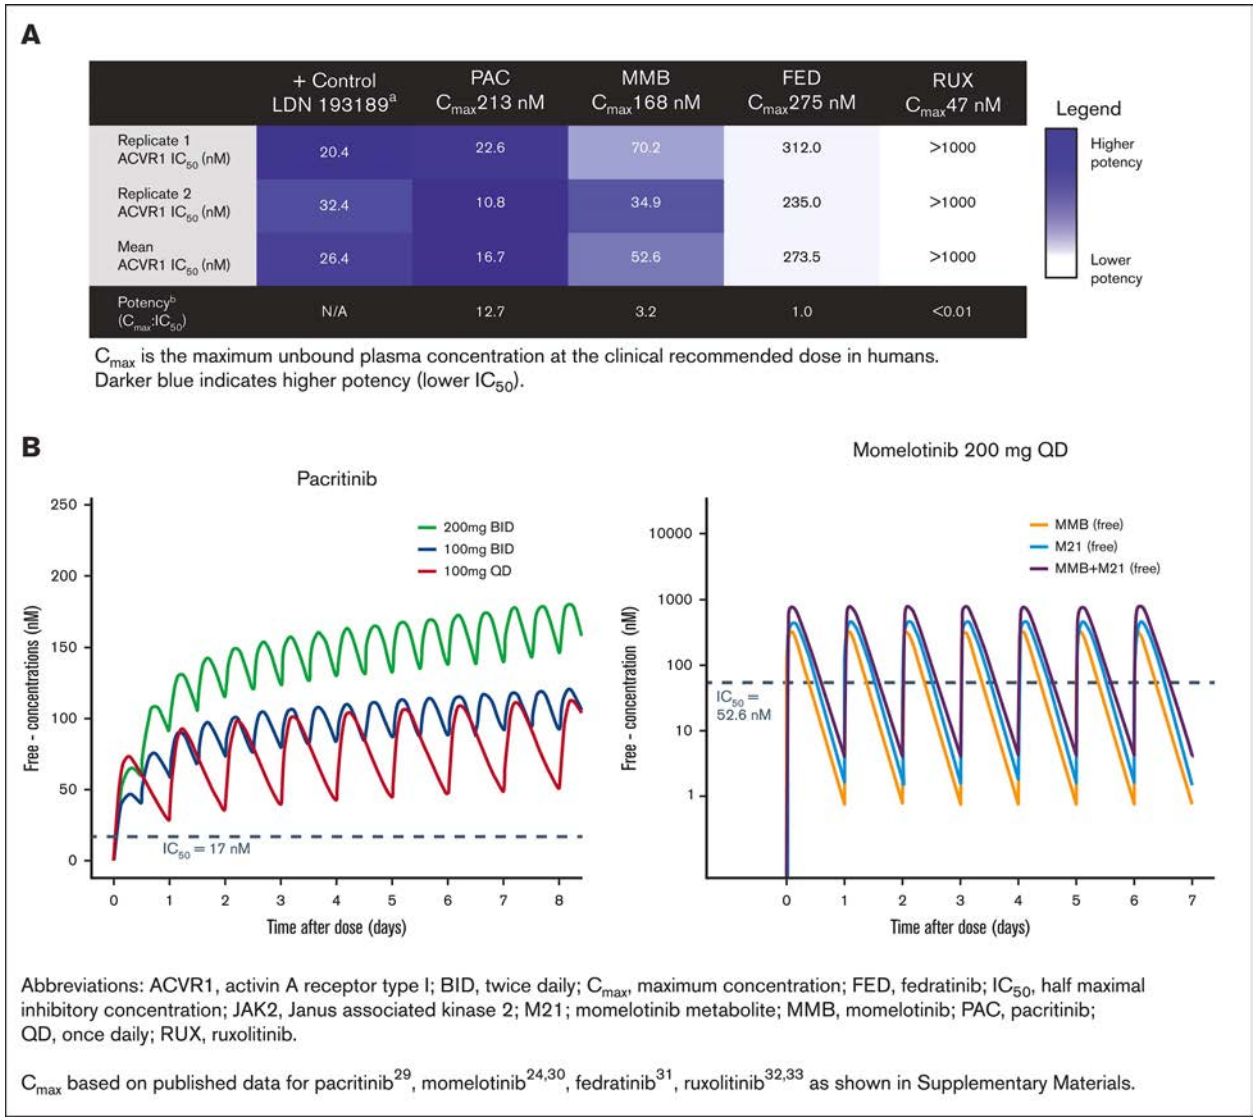
Beyond spleen/symptoms, momelotinib performed better than danazol in terms of anemia





Verstovsek et al., Lancet, 2023

Pacritinib is also a potent ACVR1 inhibitor



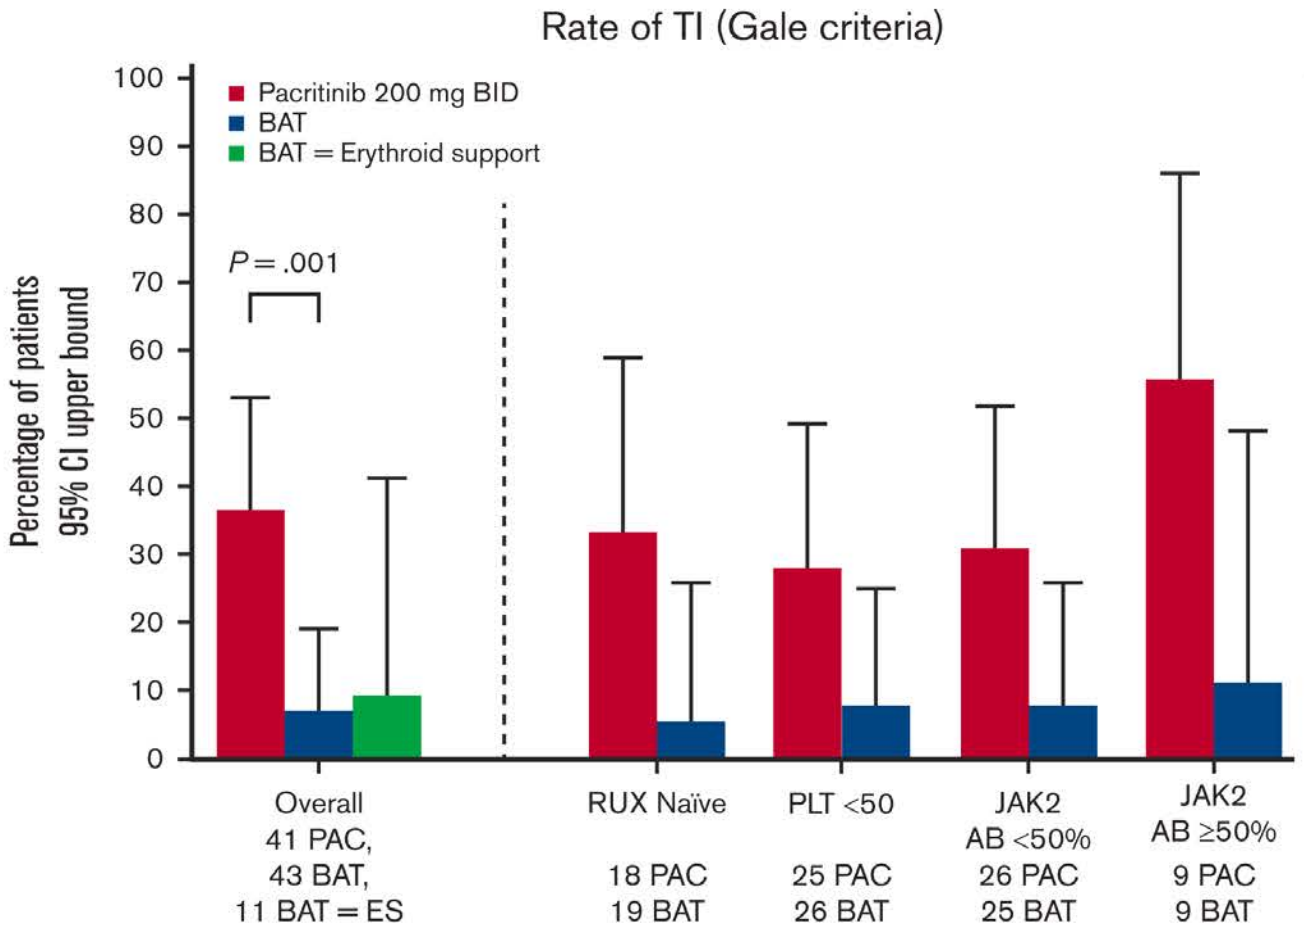
Oh S, et al. *Blood Advances*. 2023;7(19):5835-5842

In a reanalysis of the PERSIST-2 study, pacritinib was associated with favorable anemia outcomes

TI Conversion Rate

Pacritinib N = 41	BAT N = 43	*P* Value
37%	7%	.001

- TI conversion better on pacritinib than BAT, including patients receiving erythroid support agents as BAT
- Erythroid support agents were prohibited on the pacritinib arm



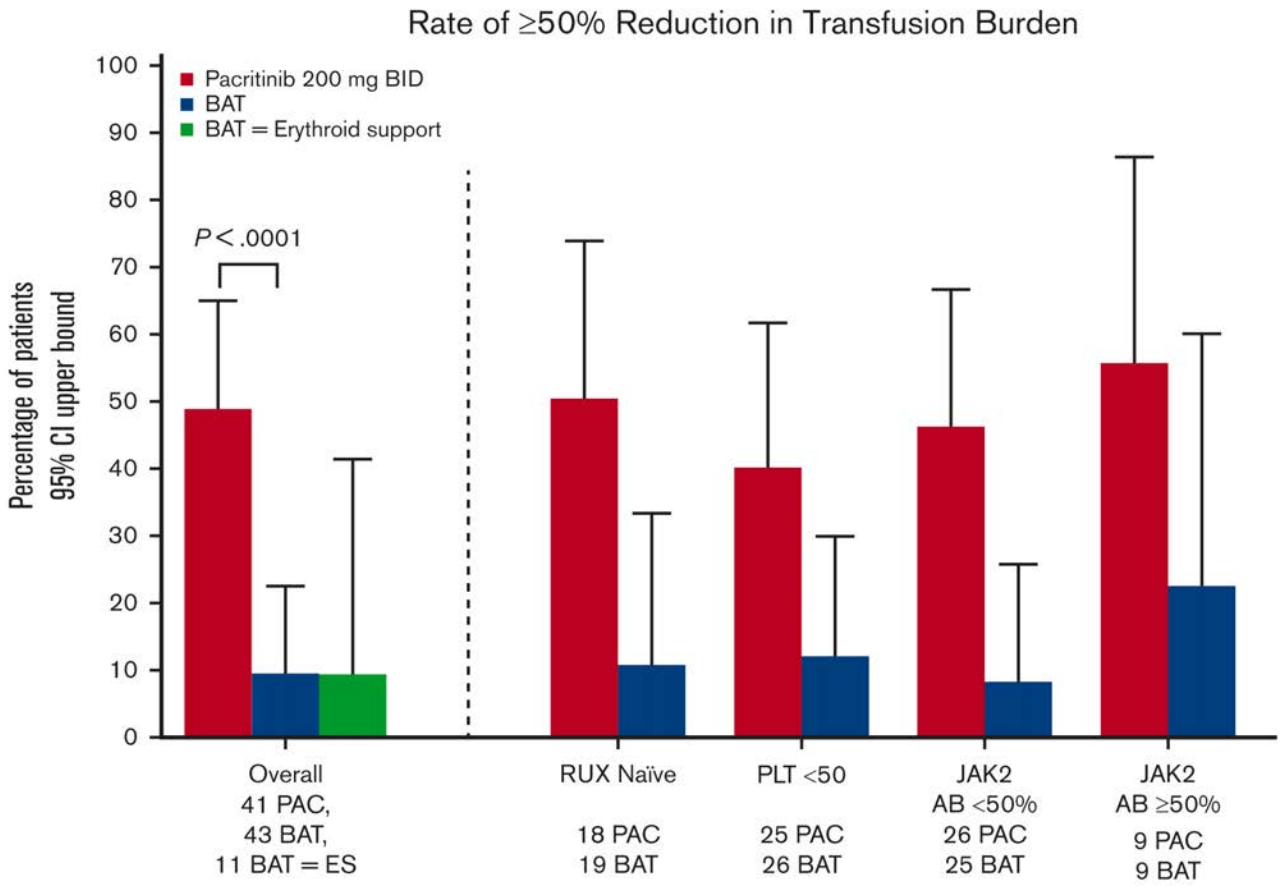
Oh S, et al. *Blood Advances*. 2023;7(19):5835-5842

In a reanalysis of the PERSIST-2 study, pacritinib was associated with favorable anemia outcomes

Transfusion Reduction

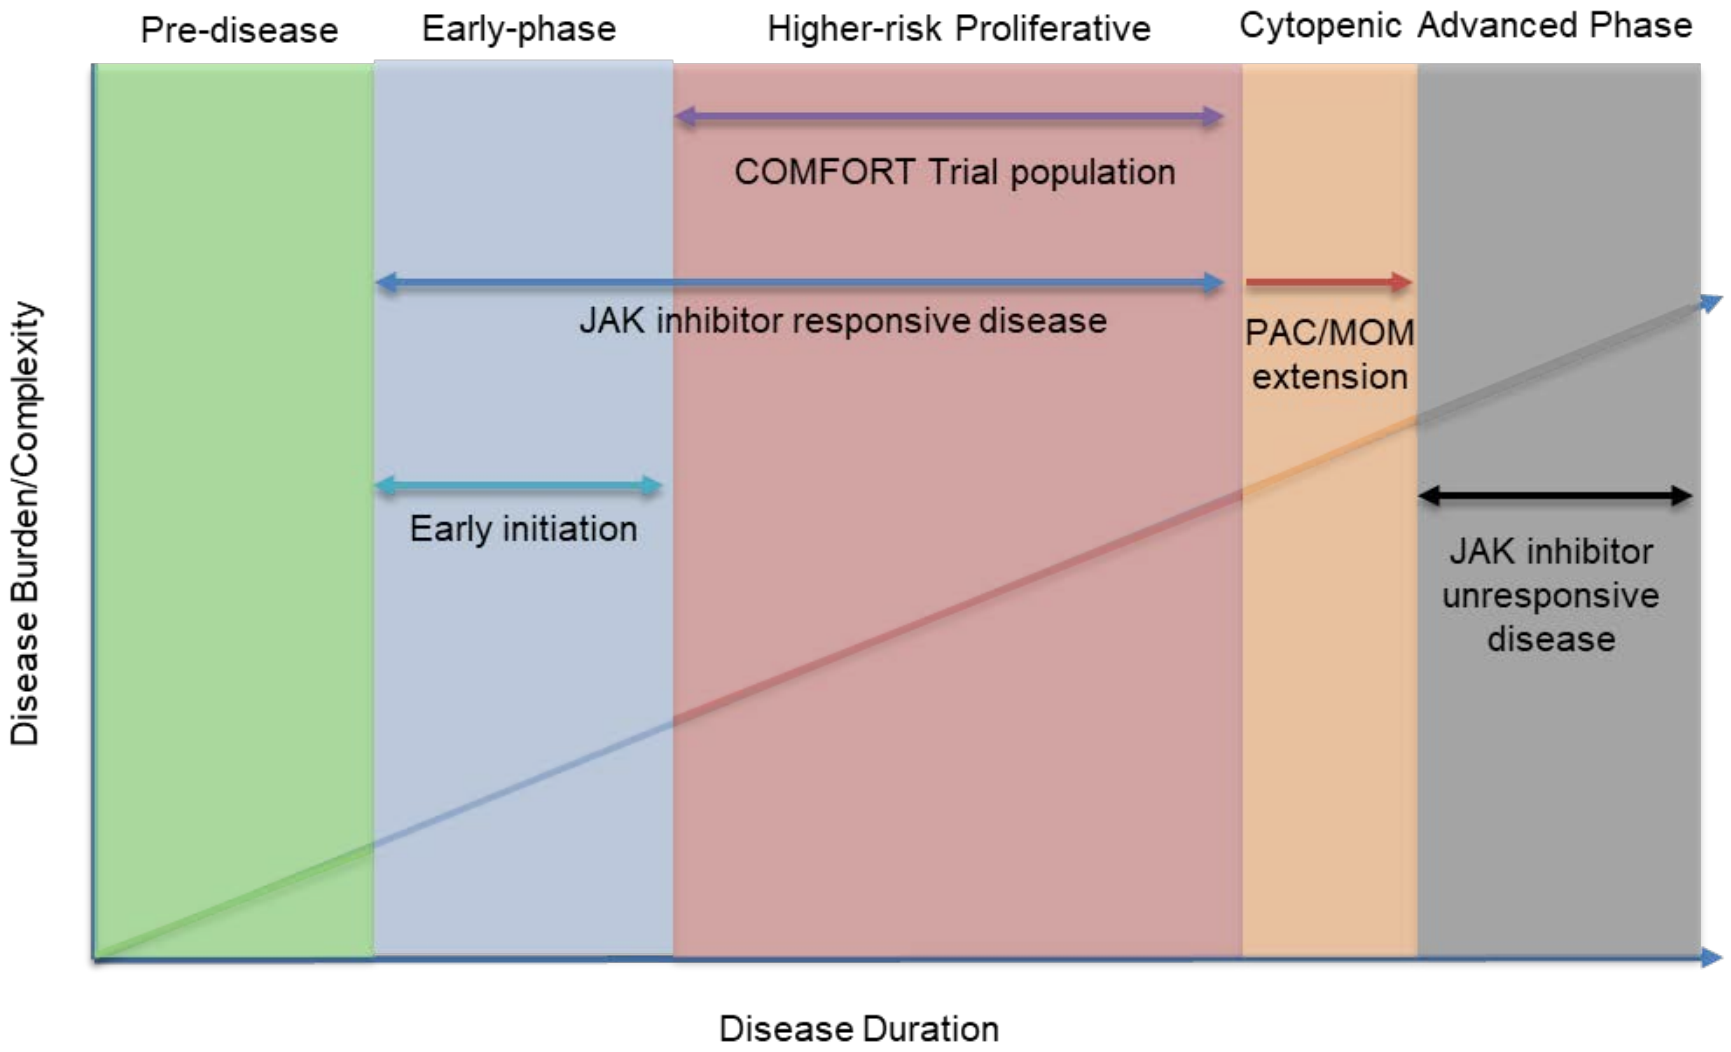
Pacritinib N = 41	BAT N = 43	*P* Value
49%	9%	.0001

- Clinically significant reduction in transfusion burden more common on pacritinib



Oh S, et al. *Blood Advances*. 2023;7(19):5835-5842

Recently approved JAK inhibitors have extended the lifespan of JAK-inhibition



Unmet Needs in Myelofibrosis

- Restore effective haematopoiesis
  - Reduce hepcidin levels
- Alter natural history of disease
  - Combination therapy
  - Direct targeting of core driver mutations
  - More comprehensive suppression of JAK-STAT pathway

Unmet Needs in Myelofibrosis

- Restore effective haematopoiesis
  - Luspatercept, ~~zilurgisertib~~, elritercept, DISC-0974
- Alter natural history of disease
  - Combination therapy
    - Pelabresib, Selinexor, Navtemadlin, Imetelstat
  - Direct targeting of core driver mutations
    - INCA033989, JNJ88549968, INCB0160058, AJ1-11095
  - More comprehensive suppression of JAK-STAT pathway

Discussion Questions

- Which JAK inhibitors, if any, have been associated with a survival benefit for patients with JAK inhibitor-naïve MF?

- A patient with intermediate-risk MF receives ruxolitinib 15 mg BID, and after 10 months he develops increasing asymptomatic splenomegaly. Platelet count = 150,000/µL, Hgb = 13.8 g/dL. Regulatory and reimbursement issues aside and assuming the patient is not a transplant candidate, which treatment would you most likely recommend?

We are taking a short break!

The program will resume at 1:00 PM ET
